       $\neg\ \text{nth}(\text{tail}(p'_1, \text{nd} - 1), 1) = \text{nth}(\text{tail}(p'_2, \text{nd} - 1), 1)$

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of minimum?,

Applying propositional simplification,

we get 3 subgoals:

`path_factor.1.2.1.1:`

{-1}	$\forall$ (x: nat): $x < \text{length}(p_1') \wedge x < \text{length}(p_2') \wedge \neg\ \text{nth}(p_1', x) = \text{nth}(p_2', x) \supset \text{nd} \leq x$
{-2}	$n' \geq 0$
{-3}	$\text{length}(p_1') \geq 1$
{-4}	$\text{path?}(g')(p_1')$
{-5}	$\text{length}(p_2') \geq 1$
{-6}	$\text{path?}(g')(p_2')$
{-7}	$\text{car}(p_1') = \text{car}(p_2')$
{-8}	$n' < \text{length}(p_1')$
{-9}	$n' < \text{length}(p_2')$
{1}	$\text{nth}(p_1', \text{nd} - 1) = \text{nth}(p_2', \text{nd} - 1)$
{2}	$\text{nd} = 0$
{3}	$\text{nth}(p_1', n') = \text{nth}(p_2', n')$

Instantiating the top quantifier in -1 with the terms: $\text{nd} - 1$,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `path_factor.1.2.1.1`.

`path_factor.1.2.1.2:`

{-1}	$\forall$ (x: nat): $x < \text{length}(p_1') \wedge x < \text{length}(p_2') \wedge \neg\ \text{nth}(p_1', x) = \text{nth}(p_2', x) \supset \text{nd} \leq x$
{-2}	$n' \geq 0$
{-3}	$\text{length}(p_1') \geq 1$
{-4}	$\text{path?}(g')(p_1')$
{-5}	$\text{length}(p_2') \geq 1$
{-6}	$\text{path?}(g')(p_2')$
{-7}	$\text{car}(p_1') = \text{car}(p_2')$
{-8}	$n' < \text{length}(p_1')$
{-9}	$n' < \text{length}(p_2')$
{1}	$p_2' = \text{append}(\text{head}(p_1', \text{nd}), \text{tail}(p_2', \text{nd}))$
{2}	$\text{nd} = 0$
{3}	$\text{nth}(p_1', n') = \text{nth}(p_2', n')$

Using lemma list_extensionality,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`path_factor.1.2.1.2.1:`

{-1}	$\text{head}(p'_1,\ \text{nd}) = \text{head}(p'_2,\ \text{nd})$
{-2}	$\text{nd} = \text{nd}$
{-3}	$\forall\ (i\colon\ \text{below}(\text{length}[T](\text{head}(p'_1,\ \text{nd})))):$ $\text{nth}(\text{head}(p'_1,\ \text{nd}),\ i) = \text{nth}(\text{head}(p'_2,\ \text{nd}),\ i)$
{-4}	$\forall\ (x\colon\ \text{nat}):$ $x < \text{length}(p'_1) \wedge x < \text{length}(p'_2) \wedge \neg\ \text{nth}(p'_1,\ x) = \text{nth}(p'_2,\ x) \supset \text{nd} \leq x$
{-5}	$n' \geq 0$
{-6}	$\text{length}(p'_1) \geq 1$
{-7}	$\text{path?}(g')(p'_1)$
{-8}	$\text{length}(p'_2) \geq 1$
{-9}	$\text{path?}(g')(p'_2)$
{-10}	$\text{car}(p'_1) = \text{car}(p'_2)$
{-11}	$n' < \text{length}(p'_1)$
{-12}	$n' < \text{length}(p'_2)$
{1}	$p'_2 = \text{append}(\text{head}(p'_1,\ \text{nd}),\ \text{tail}(p'_2,\ \text{nd}))$
{2}	$\text{nd} = 0$
{3}	$\text{nth}(p'_1,\ n') = \text{nth}(p'_2,\ n')$

Replacing using formula -1,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `path_factor.1.2.1.2.1`.

`path_factor.1.2.1.2.2:`

{-1}	$\forall\ (x\colon\ \text{nat}):$ $x < \text{length}(p'_1) \wedge x < \text{length}(p'_2) \wedge \neg\ \text{nth}(p'_1,\ x) = \text{nth}(p'_2,\ x) \supset \text{nd} \leq x$
{-2}	$n' \geq 0$
{-3}	$\text{length}(p'_1) \geq 1$
{-4}	$\text{path?}(g')(p'_1)$
{-5}	$\text{length}(p'_2) \geq 1$
{-6}	$\text{path?}(g')(p'_2)$

Hiding formulas: -2, -4, -5, 2,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -6 with the terms: n_2', n_1', p',
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of symmetric?,
Instantiating the top quantifier in -10 with the terms: n_2', n_1',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `symmetric_node_pair_distinction`.
Q.E.D.

C.98 Proofs for Graph_Relations (graph.pvs)

C.98.1 Graph_Relations.trans_closure_char_TCC1

Terse proof for `trans_closure_char_TCC1`.
`trans_closure_char_TCC1`:

$$\{1\}\quad \forall\ (x,\ y\colon T,\ l\colon \mathrm{list}[T])\colon \mathrm{length}(l) \geq 2 \supset \mathrm{path\_list?}[T](l)$$

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_list? length
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `trans_closure_char_TCC1`.
Q.E.D.

C.98.2 Graph_Relations.trans_closure_char_TCC2

Terse proof for `trans_closure_char_TCC2`.
`trans_closure_char_TCC2`:

$$\{1\}\quad \forall\ (x,\ y\colon T,\ l\colon \mathrm{list}[T])\colon \mathrm{path\_end}(l) = y \wedge \mathrm{path\_start}(l) = x \wedge \mathrm{length}(l) \geq 2 \supset (\forall\ (i\colon \mathrm{below}(\mathrm{length}[T](l) - 1))\colon i < \mathrm{length}[T](l))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `trans_closure_char_TCC2`.
Q.E.D.

C.98.3 Graph_Relations.trans_closure_char_TCC3

Terse proof for `trans_closure_char_TCC3`.
`trans_closure_char_TCC3`:

$$\{1\}\quad \forall\ (x,\ y\colon T,\ l\colon \mathrm{list}[T])\colon \mathrm{path\_end}(l) = y \wedge \mathrm{path\_start}(l) = x \wedge \mathrm{length}(l) \geq 2 \supset (\forall\ (i\colon \mathrm{below}(\mathrm{length}[T](l) - 1))\colon i + 1 < \mathrm{length}[T](l))$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `trans_closure_char_TCC3`.

Q.E.D.

C.98.4 Graph_Relations.trans_closure_char

Terse proof for `trans_closure_char`.

`trans_closure_char`:

$$
\begin{array}{l}
\\
\hline
\{1\}\quad \forall\ (R\colon\ \mathrm{PRED}\big[\big[T,\ T\big]\big],\ x,\ y\colon\ T)\colon \\
\qquad \mathrm{transitive\_closure}(R)(x,\ y)\ \equiv \\
\qquad\ (\exists\ (l\colon\ \mathrm{list}\big[T\big])\colon \\
\qquad\qquad \mathrm{length}(l)\ \geq\ 2\ \wedge \\
\qquad\qquad\ \mathrm{path\_start}(l)\ =\ x\ \wedge \\
\qquad\qquad\ \mathrm{path\_end}(l)\ =\ y\ \wedge \\
\qquad\qquad\ (\forall\ (i\colon\ \mathrm{below}(\mathrm{length}(l)-1))\colon \\
\qquad\qquad\qquad R(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ i+1))))
\end{array}
$$

Installing automatic rewrites from: path_list? length length_is_cons length_cdr

Repeatedly Skolemizing and flattening,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`trans_closure_char.1`:

$$
\begin{array}{l}
\{\text{-}1\}\quad \mathrm{transitive\_closure}(R')(x',\ y') \\
\hline
\{1\}\quad \exists\ (l\colon\ \mathrm{list}\big[T\big])\colon \\
\qquad \mathrm{length}(l)\ \geq\ 2\ \wedge \\
\qquad\ \mathrm{path\_start}(l)\ =\ x'\ \wedge \\
\qquad\ \mathrm{path\_end}(l)\ =\ y'\ \wedge \\
\qquad\ (\forall\ (i\colon\ \mathrm{below}(\mathrm{length}(l)-1))\colon\ R'(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ 1+i)))
\end{array}
$$

Expanding the definition of transitive_closure,

Instantiating the top quantifier in -1 with the terms: $\lambda\ (x,\ y\colon\ T)\colon\ \exists\ (l\colon\ \mathrm{list}\big[T\big])\colon\ \mathrm{length}(l)\ \geq\ 2\ \wedge$ path_start$(l) = x \wedge$ path_end$(l) = y \wedge (\forall\ (i\colon$ below$(\mathrm{length}(l)-1))\colon\ R'(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ 1+i)))$,

we get 3 subgoals:

`trans_closure_char.1.1:`

{-1} $(R' \subseteq \lambda\ (x,\ y:\ T):\ \exists\ (l:\ \mathrm{list}[T]):\ \mathrm{length}(l)\ \geq\ 2\ \wedge\ \mathrm{path\_start}(l)\ =\ x\ \wedge\ \mathrm{path\_end}(l)\ =$
$\wedge$
$\mathrm{transitive?}(\lambda\ (x,\ y:\ T):$
$\exists\ (l:\ \mathrm{list}[T]):$
$\mathrm{length}(l)\ \geq\ 2\ \wedge$
$\mathrm{path\_start}(l)\ =\ x\ \wedge$
$\mathrm{path\_end}(l)\ =\ y\ \wedge$
$(\forall\ (i:\ \mathrm{below}(\mathrm{length}(l)-1)):$
$R'(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ 1+i))))$
$\supset$
$(\exists\ (l:\ \mathrm{list}[T]):$
$\mathrm{length}(l)\ \geq\ 2\ \wedge$
$\mathrm{path\_start}(l)\ =\ x'\ \wedge$
$\mathrm{path\_end}(l)\ =\ y'\ \wedge$
$(\forall\ (i:\ \mathrm{below}(\mathrm{length}(l)-1)):$
$R'(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ 1+i))))$

{1} $\exists\ (l:\ \mathrm{list}[T]):$
$\mathrm{length}(l)\ \geq\ 2\ \wedge$
$\mathrm{path\_start}(l)\ =\ x'\ \wedge$
$\mathrm{path\_end}(l)\ =\ y'\ \wedge$
$(\forall\ (i:\ \mathrm{below}(\mathrm{length}(l)-1)):\ R'(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ 1+i)))$

Applying propositional simplification,

we get 2 subgoals:

`trans_closure_char.1.1.1:`

{1} $(R' \subseteq \lambda\ (x,\ y:\ T):\ \exists\ (l:\ \mathrm{list}[T]):\ \mathrm{length}(l)\ \geq\ 2\ \wedge\ \mathrm{path\_start}(l)\ =\ x\ \wedge\ \mathrm{path\_end}(l)\ =$
{2} $\exists\ (l:\ \mathrm{list}[T]):$
$\mathrm{length}(l)\ \geq\ 2\ \wedge$
$\mathrm{path\_start}(l)\ =\ x'\ \wedge$
$\mathrm{path\_end}(l)\ =\ y'\ \wedge$
$(\forall\ (i:\ \mathrm{below}(\mathrm{length}(l)-1)):\ R'(\mathrm{nth}(l,\ i),\ \mathrm{nth}(l,\ 1+i)))$

Hiding formulas: 2,

Expanding the definition(s) of (subset? member),

Repeatedly Skolemizing and flattening,

Instantiating the top quantifier in 1 with the terms: (:x''`1, $x''$`2:),

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `trans_closure_char.1.1.1`.

`trans_closure_char.1.1.2:`

{1} transitive?(λ (x, y: T):
∃ (l: list[T]):

Q.E.D.

C.99 Proofs for Graph_Util (graph.pvs)

C.99.1 Graph_Util.every_nth

Terse proof for `every_nth`.
`every_nth:`

{1}	∀ (P: PRED[T], l: list[T]): every(P)(l) ≡ (∀ (i: below(length(l))): P(nth(l, i)))

Inducting on l on formula 1,
we get 2 subgoals:
`every_nth.1:`

{1}	∀ (P: PRED[T]): every(P)(null) ≡ (∀ (i: below(length(null))): P(nth(null, i)))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `every_nth.1`.
`every_nth.2:`

{1}	∀ (cons1_var: T, cons2_var: list[T]): (∀ (P: PRED[T]): every(P)(cons2_var) ≡ (∀ (i: below(length(cons2_var))): P(nth(cons2_var, i)))) ⊃ (∀ (P: PRED[T]): every(P)(cons(cons1_var, cons2_var)) ≡ (∀ (i: below(length(cons(cons1_var, cons2_var)))): P(nth(cons(cons1_var, cons2_var), i))))

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
`every_nth.2.1:`

```
{-1}  every(P')(cons(cons1_var', cons2_var'))
{-2}  ∀ (P: PRED[T]):
        every(P)(cons2_var') ≡
          (∀ (i: below(length(cons2_var'))): P(nth(cons2_var', i)))
------------------------------------------------------------------
{1}   ∀ (i: below(length(cons(cons1_var', cons2_var')))):
        P'(nth(cons(cons1_var', cons2_var'), i))
```

Expanding the definition of every,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Repeatedly Skolemizing and flattening,
Expanding the definition of length,
Expanding the definition of nth,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Instantiating the top quantifier in -4 with the terms: $i' - 1$,
This completes the proof of `every_nth.2.1`.
`every_nth.2.2:`

```
{-1}  ∀ (i: below(length(cons(cons1_var', cons2_var')))):
        P'(nth(cons(cons1_var', cons2_var'), i))
{-2}  ∀ (P: PRED[T]):
        every(P)(cons2_var') ≡
          (∀ (i: below(length(cons2_var'))): P(nth(cons2_var', i)))
------------------------------------------------------------------
{1}   every(P')(cons(cons1_var', cons2_var'))
```

Expanding the definition of every,
Applying propositional simplification,
we get 2 subgoals:
`every_nth.2.2.1:`

```
{-1}  ∀ (i: below(length(cons(cons1_var', cons2_var')))):
        P'(nth(cons(cons1_var', cons2_var'), i))
{-2}  ∀ (P: PRED[T]):
        every(P)(cons2_var') ≡
          (∀ (i: below(length(cons2_var'))): P(nth(cons2_var', i)))
------------------------------------------------------------------
{1}   P'(cons1_var')
```

Instantiating the top quantifier in -1 with the terms: 0,
we get 2 subgoals:
`every_nth.2.2.1.1:`

```
{-1}  P'(nth(cons(cons1_var', cons2_var'), 0))
{-2}  ∀ (P: PRED[T]):

          (∀ (i: below(length(cons2_var'))): P(nth(cons2_var', i)))
------------------------------------------------------------------
{1}   P'(cons1_var')
```

Expanding the definition of nth,
which is trivially true.
This completes the proof of `every_nth.2.2.1.1`.

every_nth.2.2.1.2:

{-1}	$\forall$ (P: PRED$[T]$): every(P)(cons2_var′) $\equiv$ ($\forall$ (i: below(length(cons2_var′))): P(nth(cons2_var′, i)))
{1}	0 $<$ length$[T]$(cons$[T]$(cons1_var′, cons2_var′))
{2}	P'(cons1_var′)

Expanding the definition of length,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of every_nth.2.2.1.2.
every_nth.2.2.2:

{-1}	$\forall$ (i: below(length(cons(cons1_var′, cons2_var′)))): P'(nth(cons(cons1_var′, cons2_var′), i))
{-2}	$\forall$ (P: PRED$[T]$): every(P)(cons2_var′) $\equiv$ ($\forall$ (i: below(length(cons2_var′))): P(nth(cons2_var′, i)))
{1}	every(P')(cons2_var′)

Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: 1,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: $i' + 1$,
we get 2 subgoals:
every_nth.2.2.2.1:

{-1}	i' $<$ length(cons2_var′)
{-2}	P'(nth(cons(cons1_var′, cons2_var′), $i' + 1$))
{1}	P'(nth(cons2_var′, i'))

Expanding the definition of nth,
which is trivially true.
This completes the proof of every_nth.2.2.2.1.
every_nth.2.2.2.2:

{-1}	i' $<$ length(cons2_var′)
{1}	$1 + i'$ $<$ length$[T]$(cons$[T]$(cons1_var′, cons2_var′))
{2}	P'(nth(cons2_var′, i'))

Expanding the definition of length,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of every_nth.2.2.2.2.
Q.E.D.

C.99.2 Graph_Util.nth_append_left_TCC1

Terse proof for nth_append_left_TCC1.
nth_append_left_TCC1:

{1}	$\forall$ (l_1, l_2: list$[T]$, n: nat): n $<$ length(l_1) $\supset$ n $<$ length$[T]$(append$[T]$(l_1, l_2))

Repeatedly Skolemizing and flattening,
Rewriting using length_append, matching in *,

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nth_append_left_TCC1`.
Q.E.D.

C.99.3 Graph_Util.nth_append_left

Terse proof for `nth_append_left`.
`nth_append_left:`

{1} ∀ (l_1, l_2: list[T], n: nat):
n < length(l_1) ⊃ nth(append(l_1, l_2), n) = nth(l_1, n)

Inducting on l_1 on formula 1,
we get 3 subgoals:
`nth_append_left.1:`

{1} ∀ (l_2: list[T], n: nat):
n < length(null) ⊃ nth(append(null, l_2), n) = nth(null, n)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `nth_append_left.1`.
`nth_append_left.2:`

{1} ∀ (cons1_var: T, cons2_var: list[T]):

(∀ (l_2: list[T], n: nat):
n < length(cons(cons1_var, cons2_var)) ⊃
nth(append(cons(cons1_var, cons2_var), l_2), n) =
nth(cons(cons1_var, cons2_var), n))

Repeatedly Skolemizing and flattening,
Expanding the definition of append,
Expanding the definition of nth,
Expanding the definition of length,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using -2, matching in *,
This completes the proof of `nth_append_left.2`.
`nth_append_left.3:`

{1} ∀ (l_1, l_2: list[T], n: nat):
n < length(l_1) ⊃ n < length[T](append[T](l_1, l_2))
{2} ∀ (l_2: list[T], n: nat):
n < length(l'_1) ⊃ nth(append(l'_1, l_2), n) = nth(l'_1, n)

Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Rewriting using length_append, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nth_append_left.3`.
Q.E.D.

C.99.4 Graph_Util.nth_append_right_TCC1

Terse proof for `nth_append_right_TCC1`.

`nth_append_right_TCC1:`

{1} $\forall\ (l_1,\ l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(l_1) \wedge n < \text{length}(\text{append}(l_1,\ l_2)) \supset$
$n - \text{length}[T](l_1) \geq 0 \wedge n - \text{length}[T](l_1) < \text{length}[T](l_2)$

Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using length_append, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nth_append_right_TCC1`.
Q.E.D.

C.99.5 Graph_Util.nth_append_right

Terse proof for `nth_append_right`.

`nth_append_right:`

{1} $\forall\ (l_1,\ l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(l_1) \wedge n < \text{length}(\text{append}(l_1,\ l_2)) \supset$
$\text{nth}(\text{append}(l_1,\ l_2),\ n) = \text{nth}(l_2,\ n - \text{length}(l_1))$

Inducting on l_1 on formula 1,
we get 3 subgoals:

`nth_append_right.1:`

{1} $\forall\ (l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(\text{null}) \wedge n < \text{length}(\text{append}(\text{null},\ l_2)) \supset$
$\text{nth}(\text{append}(\text{null},\ l_2),\ n) = \text{nth}(l_2,\ n - \text{length}(\text{null}))$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `nth_append_right.1`.

`nth_append_right.2:`

{1} $\forall\ (\text{cons1\_var}\colon T,\ \text{cons2\_var}\colon \text{list}[T])\colon$
$(\forall\ (l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(\text{cons2\_var}) \wedge n < \text{length}(\text{append}(\text{cons2\_var},\ l_2)) \supset$
$\text{nth}(\text{append}(\text{cons2\_var},\ l_2),\ n) = \text{nth}(l_2,\ n - \text{length}(\text{cons2\_var})))$
$\supset$
$(\forall\ (l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(\text{cons}(\text{cons1\_var},\ \text{cons2\_var})) \wedge$
$n < \text{length}(\text{append}(\text{cons}(\text{cons1\_var},\ \text{cons2\_var}),\ l_2))$
$\supset$
$\text{nth}(\text{append}(\text{cons}(\text{cons1\_var},\ \text{cons2\_var}),\ l_2),\ n) =$
$\text{nth}(l_2,\ n - \text{length}(\text{cons}(\text{cons1\_var},\ \text{cons2\_var}))))$

Repeatedly Skolemizing and flattening,
Rewriting using length_append, matching in *,
Expanding the definition of length,

Expanding the definition of length,
Expanding the definition of append,
Expanding the definition of nth,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using -2, matching in *,
Rewriting using length_append, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nth_append_right.2`.
`nth_append_right.3`:

{1} $\forall\ (l_1,\ l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(l_1) \wedge n < \text{length}(\text{append}(l_1,\ l_2)) \supset$
$n - \text{length}[T](l_1) \geq 0 \wedge n - \text{length}[T](l_1) < \text{length}[T](l_2)$
{2} $\forall\ (l_2\colon \text{list}[T],\ n\colon \text{nat})\colon$
$n \geq \text{length}(l_1') \wedge n < \text{length}(\text{append}(l_1',\ l_2)) \supset$
$\text{nth}(\text{append}(l_1',\ l_2),\ n) = \text{nth}(l_2,\ n - \text{length}(l_1'))$

Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Rewriting using length_append, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nth_append_right.3`.
Q.E.D.

C.99.6 Graph_Util.list_pred_card

Terse proof for `list_pred_card`.
`list_pred_card`:

{1} $\forall\ (l\colon \text{list}[T],\ P\colon \text{PRED}[T])\colon$
$\text{is\_finite}(P) \wedge \text{every}(P)(l) \wedge \text{length}(l) > \text{card}(P) \supset$
$(\exists\ (n_1,\ n_2\colon \text{below}(\text{length}(l)))\colon \neg\ n_1 = n_2 \wedge \text{nth}(l,\ n_1) = \text{nth}(l,\ n_2))$

Repeatedly Skolemizing and flattening,
Letting f name LAMBDA (i: below(length(l!1))): nth(l!1, i),
Case splitting on injective?(f),
we get 2 subgoals:
`list_pred_card.1`:

{-1} injective?(f)
{-2} $(\lambda\ (i\colon \text{below}(\text{length}(l'))\colon \text{nth}(l',\ i)) = f$
{-3} is_finite(P')
{-4} every$(P')(l')$
{-5} length$(l') >$ card(P')
{1} $\exists\ (n_1,\ n_2\colon \text{below}(\text{length}(l')))\colon \neg\ n_1 = n_2 \wedge \text{nth}(l',\ n_1) = \text{nth}(l',\ n_2)$

Using lemma bijective_restrict_to_image,
Simplifying, rewriting, and recording with decision procedures,
Case splitting on (EXISTS (d: below(length[T](l!1))): TRUE) OR (FORALL (r: (image[below(length(l!1)), T] (f, fullset[below(length[T](l!1))]))): FALSE),
we get 2 subgoals:

`list_pred_card.1.1:`

{-1} $(\exists\ (d\colon\ \text{below}(\text{length}[T](l'))):\ \text{TRUE})\ \vee$
$(\forall\ (r\colon$
$(\text{image}[\text{below}(\text{length}(l')),\ T](f,\ \text{fullset}[\text{below}(\text{length}[T](l'))]))):$
FALSE)
{-2} bijective?(restrict_to_image(f))
{-3} injective?(f)
{-4} $(\lambda\ (i\colon\ \text{below}(\text{length}(l'))):\ \text{nth}(l',\ i)) = f$
{-5} is_finite(P')
{-6} every(P')(l')
{-7} $\text{length}(l') > \text{card}(P')$

{1} $\exists\ (n_1,\ n_2\colon\ \text{below}(\text{length}(l'))):\ \neg\ n_1 = n_2\ \wedge\ \text{nth}(l',\ n_1) = \text{nth}(l',\ n_2)$

Using lemma bijective_inverse_alt_is_bijective,

Using lemma card_bij,

we get 2 subgoals:

`list_pred_card.1.1.1:`

{-1} $\text{card}(\text{image}(f,\ \text{fullset}[\text{below}(\text{length}(l'))])) = \text{length}(l') \equiv$
$(\exists\ (\text{f\_1}\colon\ [(\text{image}(f,\ \text{fullset}[\text{below}(\text{length}(l'))])) \rightarrow \text{below}[\text{length}(l')]]):$
bijective?(f_1))
{-2} bijective?$[(\text{image}(f,\ \text{fullset}[\text{below}(\text{length}(l'))])),\ \text{below}(\text{length}(l'))]$
(inverse_alt(restrict_to_image(f)))
{-3} $(\exists\ (d\colon\ \text{below}(\text{length}[T](l'))):\ \text{TRUE})\ \vee$
$(\forall\ (r\colon$
$(\text{image}[\text{below}(\text{length}(l')),\ T](f,\ \text{fullset}[\text{below}(\text{length}[T](l'))]))):$
FALSE)
{-4} bijective?(restrict_to_image(f))
{-5} injective?(f)
{-6} $(\lambda\ (i\colon\ \text{below}(\text{length}(l'))):\ \text{nth}(l',\ i)) = f$
{-7} is_finite(P')
{-8} every(P')(l')
{-9} $\text{length}(l') > \text{card}(P')$

{1} $\exists\ (n_1,\ n_2\colon\ \text{below}(\text{length}(l'))):\ \neg\ n_1 = n_2\ \wedge\ \text{nth}(l',\ n_1) = \text{nth}(l',\ n_2)$

Applying disjunctive simplification to flatten sequent,

Splitting conjunctions,

we get 2 subgoals:

`list_pred_card.1.1.1.1:`

```
{-1}  card(image(f, fullset[below(length(l'))])) = length(l')
{-2}  card(image(f, fullset[below(length(l'))])) = length(l') ⊃
        (∃ (f_1: [(image(f, fullset[below(length(l'))])) → below[length(l')]]):
           bijective?(f_1))
{-3}  bijective?[(image(f, fullset[below(length(l'))])), below(length(l'))]
        (inverse_alt(restrict_to_image(f)))
{-4}  (∃ (d: below(length[T](l'))): TRUE) ∨
        (∀ (r:
              (image[below(length(l')), T](f, fullset[below(length[T](l'))]))):
           FALSE)
{-5}  bijective?(restrict_to_image(f))
{-6}  injective?(f)
{-7}  (λ (i: below(length(l'))): nth(l', i)) = f
{-8}  is_finite(P')
{-9}  every(P')(l')
{-10} length(l') > card(P')
------------------------------------------------------------------------
 {1}  ∃ (n_1, n_2: below(length(l'))): ¬ n_1 = n_2 ∧ nth(l', n_1) = nth(l', n_2)
```

Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: -2,
Using lemma card_subset,
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: -1, -2, -3, -4, -5, -6, 2,
Expanding the definition(s) of (fullset subset? member image f),
Repeatedly Skolemizing and flattening,
Rewriting using every_nth, matching in *,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `list_pred_card.1.1.1.1`.
`list_pred_card.1.1.1.2:`

```
{-1}  card(image(f, fullset[below(length(l'))])) = length(l') ⊃
        (∃ (f_1: [(image(f, fullset[below(length(l'))])) → below[length(l')]]):
           bijective?(f_1))
{-2}  bijective?[(image(f, fullset[below(length(l'))])), below(length(l'))]
        (inverse_alt(restrict_to_image(f)))
{-3}  (∃ (d: below(length[T](l'))): TRUE) ∨
        (∀ (r:
              (image[below(length(l')), T](f, fullset[below(length[T](l'))]))):
           FALSE)
{-4}  bijective?(restrict_to_image(f))
{-5}  injective?(f)
{-6}  (λ (i: below(length(l'))): nth(l', i)) = f
{-7}  is_finite(P')
{-8}  every(P')(l')
{-9}  length(l') > card(P')
------------------------------------------------------------------------
 {1}  ∃ (f_1: [(image(f, fullset[below(length(l'))])) → below[length(l')]]):
        bijective?(f_1)
 {2}  ∃ (n_1, n_2: below(length(l'))): ¬ n_1 = n_2 ∧ nth(l', n_1) = nth(l', n_2)
```

Hiding formulas: -1, 2,
Instantiating quantified variables,
This completes the proof of `list_pred_card.1.1.1.2`.

`list_pred_card.1.1.2:`

{-1} bijective?[(image(f, fullset[below(length(l'))])), below(length(l'))]
(inverse_alt(restrict_to_image(f)))
{-2} ($\exists$ (d: below(length[T](l'))): TRUE) $\vee$
($\forall$ (r:

(image[below(length(l')), T](f, fullset[below(length[T](l'))]))):
FALSE)
{2} $\exists$ (n_1, n_2: below(length(l'))): $\neg$ n_1 = n_2 $\wedge$ nth(l', n_1) = nth(l', n_2)

Applying disjunctive simplification to flatten sequent,
Hiding formulas: 3,
Repeatedly Skolemizing and flattening,
Expanding the definition of image,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
This completes the proof of `list_pred_card.1.2`.
`list_pred_card.2:`

{-1} (λ (i: below(length(l'))): nth(l', i)) = f
{-2} is_finite(P')
{-3} every(P')(l')
{-4} length(l') > card(P')

{1} injective?(f)
{2} $\exists$ (n_1, n_2: below(length(l'))): $\neg$ n_1 = n_2 $\wedge$ nth(l', n_1) = nth(l', n_2)

Expanding the definition of injective?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 2 with the terms: x'_1, x'_2,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -4,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `list_pred_card.2`.
Q.E.D.

C.99.7 Graph_Util.path_start_TCC1

Terse proof for `path_start_TCC1`.
`path_start_TCC1`:

$$\vdash$$
$$\{1\} \quad \forall\ (l\colon\ (\text{path\_list?}))\colon\ \text{cons?}[T](l)$$

Repeatedly Skolemizing and flattening,
Expanding the definition of path_list?,
Expanding the definition of length,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `path_start_TCC1`.
Q.E.D.

C.99.8 Graph_Util.path_end_TCC1

Terse proof for `path_end_TCC1`.
`path_end_TCC1`:

$$\vdash$$
$$\{1\} \quad \forall\ (l\colon\ (\text{path\_list?}))\colon \\ \quad \text{length}[T](l) - 1\ \geq\ 0\ \wedge\ \text{length}[T](l) - 1\ <\ \text{length}[T](l)$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path_end_TCC1`.
Q.E.D.

C.99.9 Graph_Util.path_list_induction_TCC1

Terse proof for `path_list_induction_TCC1`.
`path_list_induction_TCC1`:

$$\vdash$$
$$\{1\} \quad \forall\ (t\colon\ T)\colon\ \text{path\_list?}(\text{cons}[T](t,\ \text{null}[T]))$$

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_list? length
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_list_induction_TCC1`.
Q.E.D.

C.99.10 Graph_Util.path_list_induction_TCC2

Terse proof for `path_list_induction_TCC2`.

`path_list_induction_TCC2:`

{1}	∀ (p: [(path_list?) → boolean]): (∀ (t: T): p(cons(t, null))) ⊃ (∀ (t_1: T, tail: (path_list?)): p(tail) ⊃ path_list?(cons[T](t_1, tail)))

Repeatedly Skolemizing and flattening,
Hiding formulas: -2, -3,
Installing automatic rewrites from: path_list? length
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_list_induction_TCC2`.
Q.E.D.

C.99.11 Graph_Util.path_list_induction

Terse proof for `path_list_induction`.

`path_list_induction:`

{1}	∀ (p: [(path_list?) → boolean]): (∀ (t: T): p(cons(t, null))) ∧ (∀ (t: T, tail: (path_list?)): p(tail) ⊃ p(cons(t, tail))) ⊃ (∀ (l: (path_list?)): p(l))

Skolemizing and flattening,
Inducting on l on formula 1,
we get 3 subgoals:

`path_list_induction.1:`

{-1}	∀ (t: T): p'(cons(t, null))
{-2}	∀ (t: T, tail: (path_list?)): p'(tail) ⊃ p'(cons(t, tail))
{1}	path_list?(l')
{2}	p'(l')

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_list_induction.1`.

`path_list_induction.2:`

{-1}	∀ (t: T): p'(cons(t, null))
{-2}	∀ (t: T, tail: (path_list?)): p'(tail) ⊃ p'(cons(t, tail))
{1}	path_list?(null) ⊃ p'(null)

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_list? length
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_list_induction.2`.

`path_list_induction.3:`

{-1}	∀ (t: T): p'(cons(t, null))
{-2}	∀ (t: T, tail: (path_list?)): p'(tail) ⊃ p'(cons(t, tail))
{1}	∀ (cons1_var: T, cons2_var: list[T]): (path_list?(cons2_var) ⊃ p'(cons2_var)) ⊃ path_list?(cons(cons1_var, cons2_var)) ⊃ p'(cons(cons1_var, cons2_var))

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_list? length
Simplifying, rewriting, and recording with decision procedures,
Case splitting on cons2_var!1 = null,
we get 2 subgoals:
`path_list_induction.3.1:`

{-1} cons2_var′ = null
{-2} length(cons2_var′) ≥ 1 ⊃ p′(cons2_var′)
{-3} 1 + length(cons2_var′) ≥ 1
{-4} ∀ (t: T): p′(cons(t, null))
{-5} ∀ (t: T, tail: (path_list?)): p′(tail) ⊃ p′(cons(t, tail))

{1} p′(cons(cons1_var′, cons2_var′))

Hiding formulas: -2, -3,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_list_induction.3.1`.
`path_list_induction.3.2:`

{-1} length(cons2_var′) ≥ 1 ⊃ p′(cons2_var′)
{-2} 1 + length(cons2_var′) ≥ 1
{-3} ∀ (t: T): p′(cons(t, null))
{-4} ∀ (t: T, tail: (path_list?)): p′(tail) ⊃ p′(cons(t, tail))

{1} cons2_var′ = null
{2} p′(cons(cons1_var′, cons2_var′))

Simplifying, rewriting, and recording with decision procedures,
Rewriting using -4, matching in *,
This completes the proof of `path_list_induction.3.2`.
Q.E.D.

C.99.12 Graph_Util.concat_path_TCC1

Terse proof for `concat_path_TCC1`.
`concat_path_TCC1:`

{1} ∀ (lr: (concatable?)): cons?[T](PROJ_2(lr))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `concat_path_TCC1`.
Q.E.D.

C.99.13 Graph_Util.concat_path_TCC2

Terse proof for `concat_path_TCC2`.
`concat_path_TCC2:`

{1} ∀ (lr: (concatable?)): path_list?(append[T](PROJ_1(lr), cdr[T](PROJ_2(lr))))

Repeatedly Skolemizing and flattening,
Expanding the definition of concatable?,
Applying disjunctive simplification to flatten sequent,

Hiding formulas: -3,
Expanding the definition of path_list?,
Rewriting using length_append, matching in *,
Rewriting using length_cdr, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `concat_path_TCC2`.
Q.E.D.

C.99.14 Graph_Util.length_concat_path

Terse proof for `length_concat_path`.
`length_concat_path:`

{1}	$\forall$ (l, r: list$[T]$): concatable?(l, r) $\supset$ length(concat_path(l, r)) = length(l) + length(r) $-$ 1

Repeatedly Skolemizing and flattening,
Expanding the definition of concat_path,
Rewriting using length_append, matching in *,
Rewriting using length_cdr, matching in *,
we get 2 subgoals:
`length_concat_path.1:`

{-1}	concatable?(l', r')
{1}	length(r') $-$ 1 + length(l') = length(l') + length(r') $-$ 1

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `length_concat_path.1`.
`length_concat_path.2:`

{-1}	concatable?(l', r')
{1}	length(r') > 0
{2}	length(cdr(r')) = length(r') $-$ 1

Expanding the definition of concatable?,
Expanding the definition of path_list?,
which is trivially true.
This completes the proof of `length_concat_path.2`.
Q.E.D.

C.100 Proofs for Hoare (hoare.pvs)

C.100.1 Hoare.valid_TCC1

Terse proof for `valid_TCC1`.

`valid_TCC1:`

{1} ∀ (P: PRED[State], c: [State → StmtResult[State]], s):
$P(s)$ ∧ OK?($c(s)$) ⊃
OK?[State]($c(s)$) ∨
Break?[State]($c(s)$) ∨
Continue?[State]($c(s)$) ∨
Return?[State]($c(s)$) ∨
Switch?[State]($c(s)$) ∨
Default?[State]($c(s)$) ∨ Exception?[State]($c(s)$)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_TCC1`.
Q.E.D.

C.100.2 Hoare.valid_TCC2

Terse proof for `valid_TCC2`.

`valid_TCC2:`

{1} ∀ (P: PRED[State], C: [StmtResult[State] → StmtResult[State]], s):
$P(s)$ ∧ OK?(C(OK(s))) ⊃
OK?[State](C(OK[State](s))) ∨
Break?[State](C(OK[State](s))) ∨
Continue?[State](C(OK[State](s))) ∨
Return?[State](C(OK[State](s))) ∨
Switch?[State](C(OK[State](s))) ∨
Default?[State](C(OK[State](s))) ∨
Exception?[State](C(OK[State](s)))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_TCC2`.
Q.E.D.

C.100.3 Hoare.valid_and

Terse proof for `valid_and`.

`valid_and:`

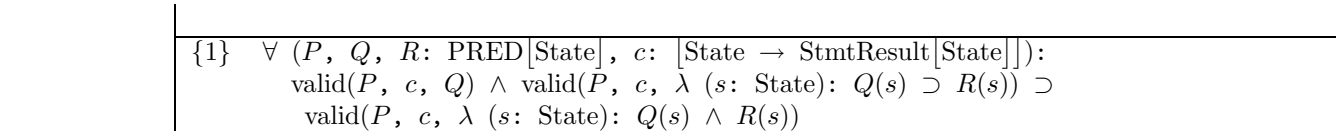
{1} ∀ (P, Q, R: PRED[State], c: [State → StmtResult[State]]):
valid(P, c, Q) ∧ valid(P, c, R) ⊃
valid(P, c, λ (s: State): $Q(s)$ ∧ $R(s)$)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_and`.
Q.E.D.

C.100.4 Hoare.valid_implied

Terse proof for `valid_implied`.

`valid_implied`:

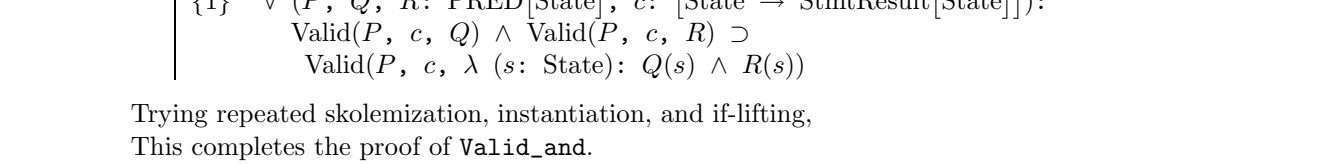


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_implied`.
Q.E.D.

C.100.5 Hoare.Valid_and

Terse proof for `Valid_and`.

`Valid_and`:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `Valid_and`.
Q.E.D.

C.101 Proofs for IA32 (constants.pvs)

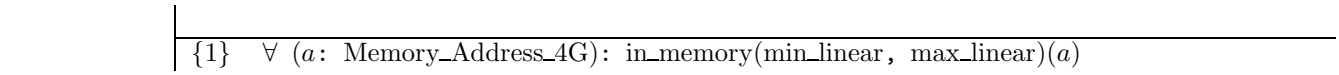
C.101.1 IA32.max_linear_offset_val

The LaTeX code for this proof is broken.

C.101.2 IA32.mem_addr_4g_TCC1

Terse proof for `mem_addr_4g_TCC1`.

`mem_addr_4g_TCC1`:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `mem_addr_4g_TCC1`.
Q.E.D.

C.102 Proofs for Import_All (everything.pvs)

This theory contains no provable formal statements.

C.103 Proofs for IntegralConversions (conversions.pvs)

This theory contains no provable formal statements.

C.104 Proofs for IntegralPromotions (conversions.pvs)

C.104.1 IntegralPromotions.int_conversion_TCC1

Terse proof for `int_conversion_TCC1`.

`int_conversion_TCC1:`

```
{1}  ∃ (x:
         [typ:
            Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                                 ({t: Cpp_Type |
                                     char?(t) ∨
                                       schar?(t) ∨
                                         uchar?(t) ∨ short?(t) ∨ ushort?(t)})) →
                          [(range(typ)) → (range(int))]]):
       TRUE
```

Instantiating the top quantifier in 1 with the terms: (λ (typ: Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE] ({t: Cpp_Type | char?(t) ∨ schar?(t) ∨ uchar?(t) ∨ short?(t) ∨ ushort?(t)})))): λ (r: (range(typ))): 0),

we get 2 subgoals:

`int_conversion_TCC1.1:`

```
{1}  TRUE
```

which is trivially true.

This completes the proof of `int_conversion_TCC1.1`.

`int_conversion_TCC1.2:`

```
{1}  ∀ (typ:
          Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                               ({t: Cpp_Type |
                                   char?(t) ∨
                                     schar?(t) ∨
                                       uchar?(t) ∨ short?(t) ∨ ushort?(t)})),
             r: (range(typ))):
        range(int)(0)
```

Repeatedly Skolemizing and flattening,

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

Rewriting using int_binary, matching in *,

Using lemma min_int,

Using lemma max_int,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `int_conversion_TCC1.2`.

Q.E.D.

C.104.2 IntegralPromotions.int_conversion_spec_TCC1

Terse proof for `int_conversion_spec_TCC1`.

`int_conversion_spec_TCC1:`

```
{1}  ∀ (typ:
           Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                                (({t: Cpp_Type |
                                       char?(t) ∨
                                        schar?(t) ∨
                                          uchar?(t) ∨ short?(t) ∨ ushort?(t)})),
                          n: (range(typ))):
       Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)
```

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:
`int_conversion_spec_TCC1.1:`

```
{1}  Cpp_Type?(int)
```

Expanding the definition of Cpp_Type?,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_par no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `int_conversion_spec_TCC1.1`.
`int_conversion_spec_TCC1.2:`

```
{1}  cv(non_bool_integral_enum?)(int)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `int_conversion_spec_TCC1.2`.
Q.E.D.

C.104.3 IntegralPromotions.int_conversion_TCC2

Terse proof for `int_conversion_TCC2`.
`int_conversion_TCC2:`

```
{1}  ∀ (typ:
           Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
                                (({t: Cpp_Type |
                                       char?(t) ∨
                                        schar?(t) ∨
                                          uchar?(t) ∨ short?(t) ∨ ushort?(t)}))):
       cv(non_bool_integral_enum?)(typ)
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `int_conversion_TCC2`.
Q.E.D.

C.104.4 IntegralPromotions.int_conversion_TCC3

Terse proof for `int_conversion_TCC3`.

`int_conversion_TCC3:`

{1} ∀ (typ:
Cpp_Subtype(cv(extend[Cpp_Type_, Cpp_Type, bool, FALSE]
({t: Cpp_Type |
char?(t) ∨
schar?(t) ∨
uchar?(t) ∨ short?(t) ∨ ushort?(t)}))):
Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:

`int_conversion_TCC3.1:`

{1} Cpp_Type?(int)

Expanding the definition of Cpp_Type?,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `int_conversion_TCC3.1`.

`int_conversion_TCC3.2:`

{1} cv(non_bool_integral_enum?)(int)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `int_conversion_TCC3.2`.
Q.E.D.

C.104.5 IntegralPromotions.bool2int_TCC1

Terse proof for `bool2int_TCC1`.

`bool2int_TCC1:`

{1} ∀ (b: bool): b ⊃ range(int)(1)

Repeatedly Skolemizing and flattening,
Expanding the definition of range,
Expanding the definition of range_integral,
Rewriting using int_binary, matching in *,
Using lemma min_int,
Using lemma max_int,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bool2int_TCC1`.
Q.E.D.

C.104.6 IntegralPromotions.bool2int_TCC2

Terse proof for `bool2int_TCC2`.

`bool2int_TCC2:`

{1} ∀ (b: bool): ¬ b ⊃ range(int)(0)

Repeatedly Skolemizing and flattening,
Expanding the definition of range,
Expanding the definition of range_integral,
Rewriting using int_binary, matching in *,
Using lemma max_int,
Using lemma min_int,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bool2int_TCC2`.
Q.E.D.

C.105 Proofs for Interpreted_Data (abstract_data.pvs)

C.105.1 Interpreted_Data.interpreted_data_type?_TCC1

Terse proof for `interpreted_data_type?_TCC1`.

`interpreted_data_type?_TCC1:`

{1} ∀ (idt: Interpreted_data_type):
(∀ (l: list[Byte], a: Address):
valid?(uidt(idt))(l, a) ≡ up?(from_byte(idt)(l, a)))
∧
(∀ (d: Data, a: Address): valid?(uidt(idt))(to_byte(idt)(d, a), a)) ∧
uninterpreted_data_type?(idt`uidt)
⊃
(∀ (d₁: Data, a₁: Address): up?[Data](from_byte(idt)(to_byte(idt)(d₁, a₁), a₁)))

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `interpreted_data_type?_TCC1`.
Q.E.D.

C.105.2 Interpreted_Data.pod_is_interpreted_data

Terse proof for `pod_is_interpreted_data`.
`pod_is_interpreted_data`:

```
{1}  ∀ (x: (pod_data_type?)): interpreted_data_type?(x)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_is_interpreted_data`.
Q.E.D.

C.105.3 Interpreted_Data.pod_size

Terse proof for `pod_size`.
`pod_size`:

```
{1}  ∀ (dt: (pod_data_type?)): size(uidt(dt)) > 0
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of pod_data_type?,
which is trivially true.
This completes the proof of `pod_size`.
Q.E.D.

C.105.4 Interpreted_Data.data_type_length

Terse proof for `data_type_length`.
`data_type_length`:

```
{1}  ∀ (addr: Address, idt: (interpreted_data_type?), l: list⌊Byte⌋):
       valid?(uidt(idt))(l, addr) ⊃ length(l) = size(uidt(idt))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `data_type_length`.
Q.E.D.

C.105.5 Interpreted_Data.length_to_byte

Terse proof for `length_to_byte`.
`length_to_byte`:

```
{1}  ∀ (addr: Address, idt: (interpreted_data_type?), data: Data):
       length(to_byte(idt)(data, addr)) = size(uidt(idt))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of interpreted_data_type?,
Expanding the definition of uninterpreted_data_type?,

Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -1 with the terms: (to_byte(idt!1)(data!1, addr!1) addr!1),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Instantiating quantified variables,
This completes the proof of `length_to_byte`.
Q.E.D.

C.105.6 Interpreted_Data.valid_from_byte

Terse proof for `valid_from_byte`.
`valid_from_byte`:

```
{1}  ∀ (addr: Address, idt: (interpreted_data_type?), l: list⌊Byte⌋):
       idt‘uidt‘valid?(l, addr) ⊃ up?(from_byte(idt)(l, addr))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_from_byte`.
Q.E.D.

C.105.7 Interpreted_Data.valid_iff_from_byte

Terse proof for `valid_iff_from_byte`.
`valid_iff_from_byte`:

```
{1}  ∀ (addr: Address, idt: (interpreted_data_type?), l: list⌊Byte⌋):
       idt‘uidt‘valid?(l, addr) ⇔ up?(from_byte(idt)(l, addr))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_iff_from_byte`.
Q.E.D.

C.105.8 Interpreted_Data.valid_to_byte

Terse proof for `valid_to_byte`.
`valid_to_byte`:

```
{1}  ∀ (addr: Address, idt: (interpreted_data_type?), data: Data):
       idt‘uidt‘valid?(to_byte(idt)(data, addr), addr)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_to_byte`.
Q.E.D.

C.105.9 Interpreted_Data.up_from_byte_to_byte

Terse proof for `up_from_byte_to_byte`.
`up_from_byte_to_byte`:

```
{1}  ∀ (addr: Address, idt: (interpreted_data_type?), data: Data):
       up?(from_byte(idt)(to_byte(idt)(data, addr), addr))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of interpreted_data_type?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `up_from_byte_to_byte`.
Q.E.D.

C.105.10 Interpreted_Data.from_byte_to_byte

Terse proof for `from_byte_to_byte`.
`from_byte_to_byte`:

{1} ∀ (addr: Address, idt: (interpreted_data_type?), data: Data):
from_byte(idt)(to_byte(idt)(data, addr), addr) = up(data)

Trying repeated skolemization, instantiation, and if-lifting,
Applying extensionality,
This completes the proof of `from_byte_to_byte`.
Q.E.D.

C.105.11 Interpreted_Data.in_blessed_memory_subset

Terse proof for `in_blessed_memory_subset`.
`in_blessed_memory_subset`:

{1} ∀ (addr: Address, idt: (interpreted_data_type?), address_range: PRED⌊Address⌋):
in_blessed_memory?(idt, addr, address_range) ⊃
(address_block(addr, size(uidt(idt))) ⊆ address_range)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `in_blessed_memory_subset`.
Q.E.D.

C.106 Proofs for Interpreted_Data_Lift (abstract_data.pvs)

This theory contains no provable formal statements.

C.107 Proofs for IterationStatements1 (statements.pvs)

C.107.1 IterationStatements1.iterate_while_TCC1

Terse proof for `iterate_while_TCC1`.
`iterate_while_TCC1`:

{1} ∀ (n: nat, s: State): ¬ $n = 0$ ⊃ $n - 1 \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `iterate_while_TCC1`.
Q.E.D.

C.107.2 IterationStatements1.iterate_while_TCC2

Terse proof for `iterate_while_TCC2`.
`iterate_while_TCC2:`

```
{1}  ∀ (n: nat, s: State): ¬ n = 0 ⊃ n − 1 < n
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `iterate_while_TCC2`.
Q.E.D.

C.107.3 IterationStatements1.while_termination_point?_TCC1

Terse proof for `while_termination_point?_TCC1`.
`while_termination_point?_TCC1:`

```
{1}  ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]],
          s: State, n: nat, res: StmtResult[State]):
        OK?(res) ∧ res = iterate_while(n, b_ex, body)(s) ⊃
         OK?[State](res) ∨
          Break?[State](res) ∨
           Continue?[State](res) ∨
            Return?[State](res) ∨
             Switch?[State](res) ∨ Default?[State](res) ∨ Exception?[State](res)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `while_termination_point?_TCC1`.
Q.E.D.

C.107.4 IterationStatements1.while_TCC1

Terse proof for `while_TCC1`.
`while_TCC1:`

```
{1}  ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]],
          s: State):
        (∃ (n: nat): while_termination_point?(b_ex, body, s)(n)) ⊃
         nonempty?[nat](while_termination_point?(b_ex, body, s))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `while_TCC1`.
Q.E.D.

C.107.5 IterationStatements1.nonzero_min_while_termination_point

Terse proof for `nonzero_min_while_termination_point`.

`nonzero_min_while_termination_point:`

```
{1}  ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]],
          s: State):
       (∃ (n: nat): while_termination_point?(b_ex, body, s)(n)) ∧
        ¬ min[nat](while_termination_point?(b_ex, body, s)) = 0
        ⊃ OK?(b_ex(s)) ∧ data(b_ex(s))
```

Repeatedly Skolemizing and flattening,

Rewriting using min_def, matching in *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `nonzero_min_while_termination_point`.

Q.E.D.

C.107.6 IterationStatements1.while_as_if_while

Terse proof for `while_as_if_while`.

`while_as_if_while:`

```
{1}  ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]]):
       while(b_ex, body) =
        if_else(b_ex, body ## catch_continue ## while(b_ex, body) ## catch_break, skip)
```

Expanding the definition of while,

Expanding the definition of if_else,

Repeatedly Skolemizing and flattening,

Applying decompose-equality,

we get 3 subgoals:

`while_as_if_while.1:`

```
{1}  IF ∃ (n: nat): while_termination_point?(b_ex′, body′, x′)(n)
       THEN (iterate_while(min[nat](while_termination_point?(b_ex′, body′, x′)), b_ex′,
                           body′)
               ## e2s(b_ex′)
               ## catch_break)
                (x′)
     ELSE Hang
     ENDIF
      =
      (b_ex′ ##
         (λ (b: bool):
            IF b
              THEN (body′ ## catch_continue ##
                      (λ (s: State):
                         IF ∃ (n: nat): while_termination_point?(b_ex′, body′, s)(n)
                           THEN (iterate_while(min[nat]
                                               (while_termination_point?(b_ex′,
                                                                         body′,
                                                                         s)),
                                               b_ex′, body′)
                                   ## e2s(b_ex′)
                                   ## catch_break)
                                    (s)
                         ELSE Hang
                         ENDIF))
                    ## catch_break
            ELSE skip
            ENDIF))
          (x′)
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`while_as_if_while.1.1:`

```
{-1}  ∃ (n: nat): while_termination_point?(b_ex′, body′, x′)(n)
{1}   (iterate_while(min⌊nat⌋(while_termination_point?(b_ex′, body′, x′)), b_ex′, body′) ##
         e2s(b_ex′)
         ## catch_break)
          (x′)
       =
       (b_ex′ ##
          (λ (b: bool):
             IF b
               THEN (body′ ## catch_continue ##
                       (λ (s: State):
                          IF ∃ (n: nat): while_termination_point?(b_ex′, body′, s)(n)
                            THEN (iterate_while(min⌊nat⌋
                                                (while_termination_point?(b_ex′,
                                                                          body′,
                                                                          s)),
                                                b_ex′, body′)
                                    ## e2s(b_ex′)
                                    ## catch_break)
                                     (s)
                          ELSE Hang
                          ENDIF))
                    ## catch_break
             ELSE skip
             ENDIF))
           (x′)
```

Case splitting on min(while_termination_point?(b_ex!1, body!1, x!1)) = 0,

we get 2 subgoals:

`while_as_if_while.1.1.1:`

```
{-1}  min(while_termination_point?(b_ex′, body′, x′)) = 0
{-2}  ∃ (n: nat): while_termination_point?(b_ex′, body′, x′)(n)

C.107.7 IterationStatements1.iterate_do_as_while

Terse proof for `iterate_do_as_while`.
`iterate_do_as_while:`

{1} ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]], n: nat): iterate_do(n, body, b_ex) = (body ## catch_continue ## iterate_while(n, b_ex, body))

Inducting on n on formula 1,
we get 2 subgoals:
`iterate_do_as_while.1:`

{1} ∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]]): iterate_do(0, body, b_ex) = (body ## catch_continue ## iterate_while(0, b_ex, body))

Repeatedly Skolemizing and flattening,
Applying decompose-equality,
Trying repeated skolemization, instantiation, and if-lifting,
Applying decompose-equality,
This completes the proof of `iterate_do_as_while.1`.
`iterate_do_as_while.2:`

{1} ∀ j: (∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]]): iterate_do(j, body, b_ex) = (body ## catch_continue ## iterate_while(j, b_ex, body))) ⊃ (∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtResult[State]]): iterate_do(j + 1, body, b_ex) = (body ## catch_continue ## iterate_while(j + 1, b_ex, body)))

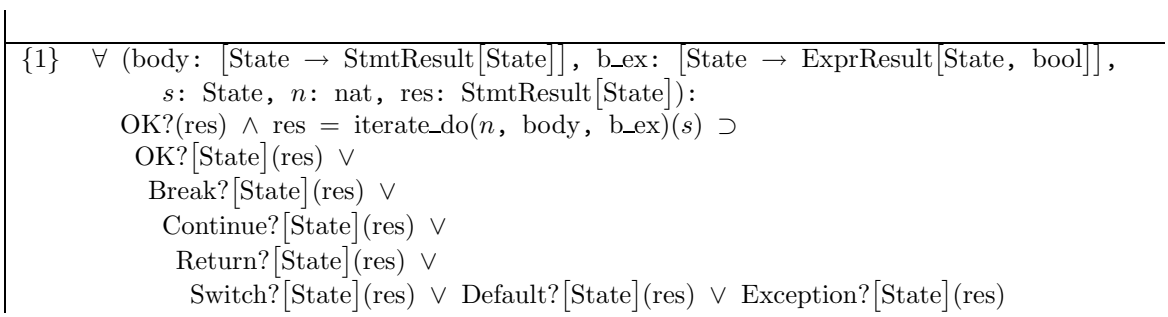
Repeatedly Skolemizing and flattening,
Expanding the definition of iterate_do,
Expanding the definition of iterate_while,
Applying decompose-equality,
Instantiating quantified variables,
Replacing using formula -2,

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `iterate_do_as_while.2`.
Q.E.D.

C.107.8 IterationStatements1.do_termination_point?_TCC1

Terse proof for `do_termination_point?_TCC1`.

`do_termination_point?_TCC1:`

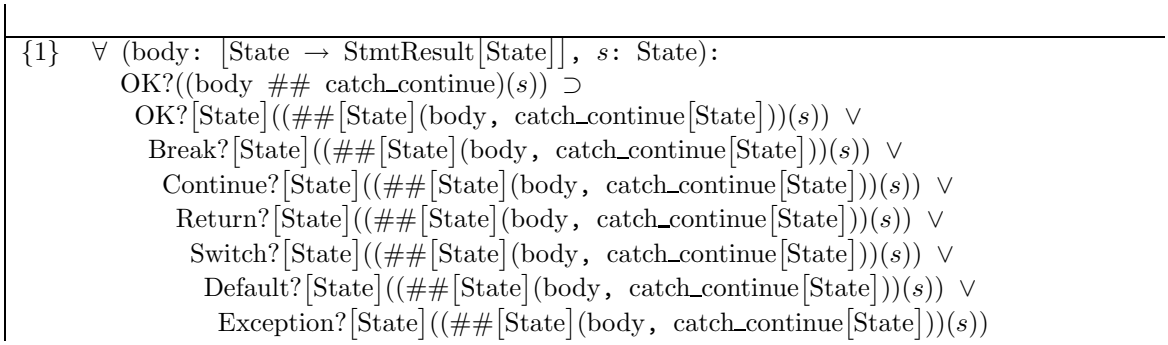


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `do_termination_point?_TCC1`.
Q.E.D.

C.107.9 IterationStatements1.termination_point_do_as_while_TCC1

Terse proof for `termination_point_do_as_while_TCC1`.

`termination_point_do_as_while_TCC1:`

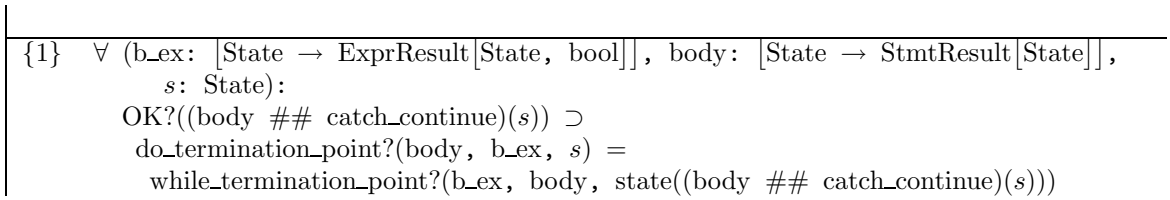


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `termination_point_do_as_while_TCC1`.
Q.E.D.

C.107.10 IterationStatements1.termination_point_do_as_while

Terse proof for `termination_point_do_as_while`.

termination_point_do_as_while:



Repeatedly Skolemizing and flattening,

Applying decompose-equality,

Expanding the definition of do_termination_point?,

Expanding the definition of while_termination_point?,

Rewriting using iterate_do_as_while, matching in *,

Trying repeated skolemization, instantiation, and if-lifting,

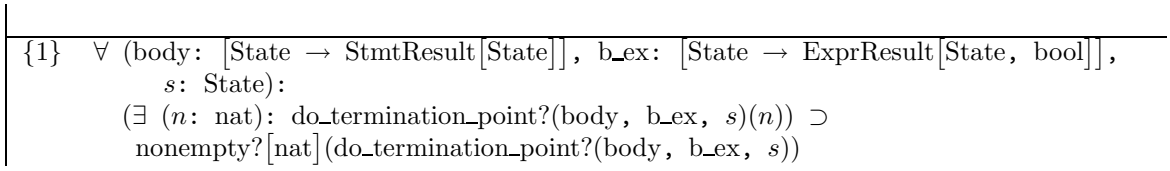
This completes the proof of termination_point_do_as_while.

Q.E.D.

C.107.11 IterationStatements1.do_while_TCC1

Terse proof for do_while_TCC1.

do_while_TCC1:



Trying repeated skolemization, instantiation, and if-lifting,

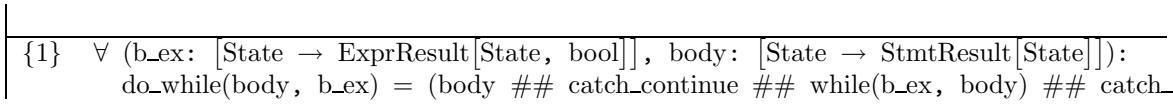
This completes the proof of do_while_TCC1.

Q.E.D.

C.107.12 IterationStatements1.do_as_while

Terse proof for do_as_while.

do_as_while:



Repeatedly Skolemizing and flattening,

Expanding the definition of do_while,

Expanding the definition of while,

Applying decompose-equality,

we get 3 subgoals:

`do_as_while.1:`

```
{1}  IF ∃ (n: nat): do_termination_point?(body′, b_ex′, x′)(n)
       THEN (iterate_do(min[nat](do_termination_point?(body′, b_ex′, x′)), body′, b_ex′)
               ## e2s(b_ex′)
               ## catch_break)
                (x′)
     ELSE Hang
     ENDIF
      =
     ((body′ ## catch_continue ##
           (λ (s: State):
               IF ∃ (n: nat): while_termination_point?(b_ex′, body′, s)(n)
                 THEN (iterate_while(min[nat](while_termination_point?(b_ex′, body′, s)),
                                     b_ex′, body′)
                             ## e2s(b_ex′)
                             ## catch_break)
                              (s)
               ELSE Hang
               ENDIF))
        ## catch_break)
         (x′)
```

Installing automatic rewrites from: (iterate_do_as_while! termination_point_do_as_while!)

Case splitting on OK?((body!1 ## catch_continue)(x!1)),

we get 2 subgoals:

`do_as_while.1.1:`

```
{-1}  OK?((body′ ## catch_continue)(x′))
{1}  IF ∃ (n: nat): do_termination_point?(body′, b_ex′, x′)(n)
       THEN (iterate_do(min[nat](do_termination_point?(body′, b_ex′, x′)), body′, b_ex′)
               ## e2s(b_ex′)
               ## catch_break)
                (x′)
     ELSE Hang
     ENDIF
      =
     ((body′ ## catch_continue ##
           (λ (s: State):
               IF ∃ (n: nat): while_termination_point?(b_ex′, body′, s)(n)
                 THEN (iterate_while(min[nat](while_termination_point?(b_ex′, body′, s)),
                                     b_ex′, body′)
                             ## e2s(b_ex′)
                             ## catch_break)
                              (s)
               ELSE Hang
               ENDIF))
        ## catch_break)
         (x′)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `do_as_while.1.1`.

`do_as_while.1.2:`

{1} OK?((body′ ## catch_continue)(x′))
{2} IF ∃ (n: nat): do_termination_point?(body′, b_ex′, x′)(n)
THEN (iterate_do(min[nat](do_termination_point?(body′, b_ex′, x′)), body′, b_ex′)
e2s(b_ex′)
catch_break)
(x′)
ELSE Hang
ENDIF
=
((body′ ## catch_continue ##
(λ (s: State):
IF ∃ (n: nat): while_termination_point?(b_ex′, body′, s)(n)
THEN (iterate_while(min[nat](while_termination_point?(b_ex′, body′, s)),
b_ex′, body′)
e2s(b_ex′)
catch_break)
(s)
ELSE Hang
ENDIF))
catch_break)
(x′)

Trying repeated skolemization, instantiation, and if-lifting,
we get 2 subgoals:
`do_as_while.1.2.1:`

{-1} Break?(body′(x′))
{1} ∃ (n: nat): do_termination_point?(body′, b_ex′, x′)(n)

Instantiating the top quantifier in 1 with the terms: 0,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `do_as_while.1.2.1`.
`do_as_while.1.2.2:`

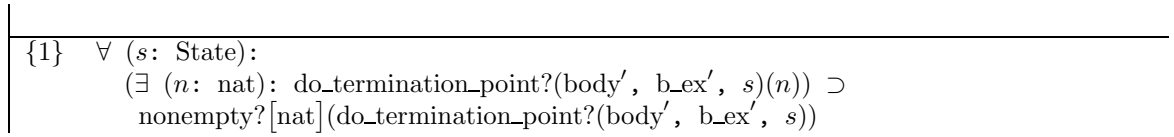
{1} Continue?(body′(x′))
{2} OK?(body′(x′))
{3} ∃ (n: nat): do_termination_point?(body′, b_ex′, x′)(n)
{4} Hang?(body′(x′))

Instantiating the top quantifier in 3 with the terms: 0,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `do_as_while.1.2.2`.
`do_as_while.2:`

{1} ∀ (s: State):
(∃ (n: nat): while_termination_point?(b_ex′, body′, s)(n)) ⊃
nonempty?[nat](while_termination_point?(b_ex′, body′, s))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `do_as_while.2`.

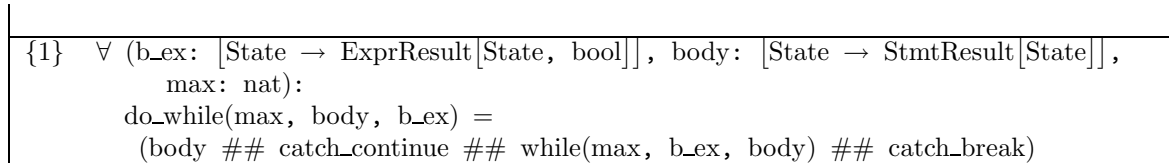
do_as_while.3:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of do_as_while.3.
Q.E.D.

C.107.13 IterationStatements1.do_while_unroll

Terse proof for do_while_unroll.
do_while_unroll:

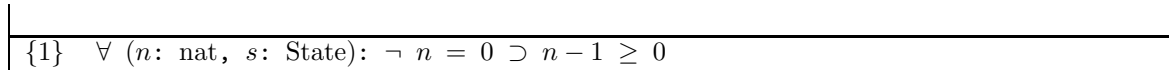


Repeatedly Skolemizing and flattening,
Expanding the definition of do_while,
Expanding the definition of while,
Rewriting using do_as_while, matching in *,
This completes the proof of do_while_unroll.
Q.E.D.

C.108 Proofs for IterationStatements2 (statements.pvs)

C.108.1 IterationStatements2.iterate_for_TCC1

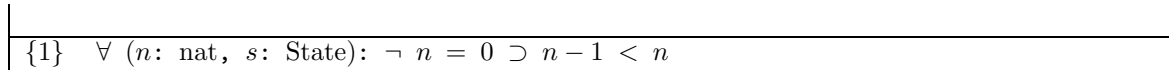
Terse proof for iterate_for_TCC1.
iterate_for_TCC1:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of iterate_for_TCC1.
Q.E.D.

C.108.2 IterationStatements2.iterate_for_TCC2

Terse proof for iterate_for_TCC2.
iterate_for_TCC2:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of iterate_for_TCC2.
Q.E.D.

C.108.3 IterationStatements2.iterate_for_as_while_TCC1

Terse proof for `iterate_for_as_while_TCC1`.

`iterate_for_as_while_TCC1:`

$$\{1\}\quad \forall\ (n\colon \text{nat})\colon\ n > 0 \supset n - 1 \geq 0$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `iterate_for_as_while_TCC1`.

Q.E.D.

C.108.4 IterationStatements2.iterate_for_as_while

Terse proof for `iterate_for_as_while`.

`iterate_for_as_while:`

$$\begin{array}{l}\{1\}\quad \forall\ (\text{b\_ex}\colon [\text{State} \to \text{ExprResult}[\text{State}, \text{bool}]],\ \text{body}\colon [\text{State} \to \text{StmtResult}[\text{State}]],\\ \qquad\quad \text{expr}\colon [\text{State} \to \text{ExprResult}[\text{State}, \text{ExprData}]],\ n\colon \text{nat})\colon\\ \qquad n > 0 \supset\\ \qquad\ \text{iterate\_for}(n, \text{b\_ex}, \text{expr}, \text{body}) =\\ \qquad\quad (\text{e2s}(\text{b\_ex}) \mathbin{\#\#} \text{body} \mathbin{\#\#} \text{catch\_continue} \mathbin{\#\#} \text{iterate\_while}(n-1, \text{expr} \mathbin{\#\#} \text{b\_ex}, \text{body})\\ \qquad\qquad \mathbin{\#\#} \text{e2s}(\text{expr}))\end{array}$$

Inducting on n on formula 1,

we get 3 subgoals:

`iterate_for_as_while.1:`

$$\begin{array}{l}\{1\}\quad \forall\ (\text{b\_ex}\colon [\text{State} \to \text{ExprResult}[\text{State}, \text{bool}]],\ \text{body}\colon [\text{State} \to \text{StmtResult}[\text{State}]],\\ \qquad\quad \text{expr}\colon [\text{State} \to \text{ExprResult}[\text{State}, \text{ExprData}]])\colon\\ \qquad 0 > 0 \supset\\ \qquad\ \text{iterate\_for}(0, \text{b\_ex}, \text{expr}, \text{body}) =\\ \qquad\quad (\text{e2s}(\text{b\_ex}) \mathbin{\#\#} \text{body} \mathbin{\#\#} \text{catch\_continue} \mathbin{\#\#} \text{iterate\_while}(0-1, \text{expr} \mathbin{\#\#} \text{b\_ex}, \text{body}) \#\\ \qquad\qquad \text{e2s}(\text{expr}))\end{array}$$

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `iterate_for_as_while.1`.

`iterate_for_as_while.2:`

```
{1}  ∀ j:
       (∀ (b_ex: [State → ExprResult[State, bool]], body: [State → StmtRe-
     sult[State]],
           expr: [State → ExprResult[State, ExprData]]):
         j > 0 ⊃
          iterate_for(j, b_ex, expr, body) =
           (e2s(b_ex) ## body ## catch_continue ##
              iterate_while(j − 1, expr ## b_ex, body)
              ## e2s(expr)))
       ⊃

C.111 Proofs for JumpStatements1 (statements.pvs)

This theory contains no provable formal statements.

C.112 Proofs for JumpStatements2 (statements.pvs)

This theory contains no provable formal statements.

C.113 Proofs for LabeledStatements (statements.pvs)

This theory contains no provable formal statements.

C.114 Proofs for Linear_Memory (linear_memory.pvs)

C.114.1 Linear_Memory.xlat_idx_TCC1

Terse proof for `xlat_idx_TCC1`.
`xlat_idx_TCC1:`

```
{1}  ∀ (lvl: Level, base, addr: Memory_Address_4G): offset(addr) ≥ 0
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `xlat_idx_TCC1`.
Q.E.D.

C.114.2 Linear_Memory.xlat_idx_TCC2

Terse proof for `xlat_idx_TCC2`.
`xlat_idx_TCC2:`

{1} ∀ (lvl: Level, base, addr: Memory_Address_4G):
bus_width − (lvl + 1) × bits_per_level ≥ 0

Trying repeated skolemization, instantiation, and if-lifting,
Using lemma bus_width,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `xlat_idx_TCC2`.
Q.E.D.

C.114.3 Linear_Memory.xlat_idx_pe_aligned_TCC1

Terse proof for `xlat_idx_pe_aligned_TCC1`.
`xlat_idx_pe_aligned_TCC1:`

{1} ∀ (lvl: Level, base, addr: Memory_Address_4G): offset(base) ≥ 0

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `xlat_idx_pe_aligned_TCC1`.
Q.E.D.

C.114.4 Linear_Memory.xlat_idx_pe_aligned_TCC2

Terse proof for `xlat_idx_pe_aligned_TCC2`.
`xlat_idx_pe_aligned_TCC2:`

{1} ∀ (lvl: Level, base, addr: Memory_Address_4G):
aligned?(bits_per_level + pe_size)(offset(base)) ⊃
offset(xlat_idx(lvl, base, addr)) ≥ 0

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `xlat_idx_pe_aligned_TCC2`.
Q.E.D.

C.114.5 Linear_Memory.xlat_idx_pe_aligned

Terse proof for `xlat_idx_pe_aligned`.
`xlat_idx_pe_aligned:`

{1} ∀ (lvl: Level, base, addr: Memory_Address_4G):
aligned?(bits_per_level + pe_size)(offset(base)) ⊃
aligned?(pe_size)(offset(xlat_idx(lvl, base, addr)))

Repeatedly Skolemizing and flattening,
Expanding the definition of xlat_idx,
Installing automatic rewrites from: (bus_width! bits_per_level! max_level!)
Case splitting on -1 * (bits_per_level * lvl!1) - bits_per_level + bus_width >= 0,
we get 2 subgoals:

`xlat_idx_pe_aligned.1:`

{-1}	$-1 \times (\text{bits\_per\_level} \times \text{lvl}') - \text{bits\_per\_level} + \text{bus\_width} \geq 0$
{-2}	$\text{lvl}' < \text{max\_level}$
{-3}	Mem?(base′‘type_of)
{-4}	$0 \leq$ base′‘offset
{-5}	base′‘offset $<$ max_linear_offset
{-6}	Mem?(addr′‘type_of)
{-7}	$0 \leq$ addr′‘offset
{-8}	addr′‘offset $<$ max_linear_offset
{-9}	aligned?(bits_per_level + pe_size)(offset(base′))
{1}	aligned?(pe_size) (offset (base′ + shift_bits_left(cut_bits(offset(addr′), $-1 \times$ bits_per_level $\times$ lvl′ $-$ bits_per_lev

Using lemma aligned_shift_bits_ok,

we get 2 subgoals:

`xlat_idx_pe_aligned.1.1:`

{-1}	pe_size $\leq$ pe_size $\supset$ aligned?(pe_size) (shift_bits_left(cut_bits(offset(addr′), bus_width $-$ (lvl′ + 1) $\times$ bits_per_level, bits_per_level), pe_size))
{-2}	$-1 \times (\text{bits\_per\_level} \times \text{lvl}') - \text{bits\_per\_level} + \text{bus\_width} \geq 0$
{-3}	$\text{lvl}' < \text{max\_level}$
{-4}	Mem?(base′‘type_of)
{-5}	$0 \leq$ base′‘offset
{-6}	base′‘offset $<$ max_linear_offset
{-7}	Mem?(addr′‘type_of)
{-8}	$0 \leq$ addr′‘offset
{-9}	addr′‘offset $<$ max_linear_offset
{-10}	aligned?(bits_per_level + pe_size)(offset(base′))
{1}	aligned?(pe_size) (offset (base′ + shift_bits_left(cut_bits(offset(addr′), $-1 \times$ bits_per_level $\times$ lvl′ $-$ bits_per_le

Expanding the definition of +,

Using lemma aligned_plus,

we get 4 subgoals:

`xlat_idx_pe_aligned.1.1.1:`

```
{-1}  aligned?(min(bits_per_level + pe_size, pe_size))
                (offset(base′) + shift_bits_left(cut_bits(offset(addr′), bus_width − (lvl′ + 1) × bits_per_level, bits_pe
{-2}  pe_size ≤ pe_size ⊃
       aligned?(pe_size)
                (shift_bits_left(cut_bits(offset(addr′),
                                          bus_width − (lvl′ + 1) × bits_per_level,
                                          bits_per_level),
                                 pe_size))
{-3}  −1 × (bits_per_level × lvl′) − bits_per_level + bus_width ≥ 0
{-4}  lvl′ < max_level
{-5}  Mem?(base′`type_of)
{-6}  0 ≤ base′`offset
{-7}  base′`offset < max_linear_offset
{-8}  Mem?(addr′`type_of)
{-9}  0 ≤ addr′`offset
{-10} addr′`offset < max_linear_offset
{-11} aligned?(bits_per_level + pe_size)(offset(base′))
------------------------------------------------------------------------------
 {1}  aligned?(pe_size)
                (base′`offset + shift_bits_left(cut_bits(offset(addr′), −1 × bits_per_level × lvl′ − bits_per_level + bus_
```

Expanding the definition of min,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `xlat_idx_pe_aligned.1.1.1`.

`xlat_idx_pe_aligned.1.1.2:`

```
{-1}  pe_size ≤ pe_size ⊃
       aligned?(pe_size)
                (shift_bits_left(cut_bits(offset(addr′),
                                          bus_width − (lvl′ + 1) × bits_per_level,
                                          bits_per_level),
                                 pe_size))
{-2}  −1 × (bits_per_level × lvl′) − bits_per_level + bus_width ≥ 0
{-3}  lvl′ < max_level
{-4}  Mem?(base′`type_of)
{-5}  0 ≤ base′`offset
{-6}  base′`offset < max_linear_offset
{-7}  Mem?(addr′`type_of)
{-8}  0 ≤ addr′`offset

s: Linear_memory):
aligned?(bits_per_level + pe_size)(offset(base)) ∧
OK?(translate(lvl, base, addr, access, priv)(s)) ∧
data(translate(lvl, base, addr, access, priv)(s))`1
⊃
aligned?(bus_width − bits_per_level × (lvl + 1))
(offset(data(translate(lvl, base, addr, access, priv)(s))`2))

Repeatedly Skolemizing and flattening,

Expanding the definition of translate,

Installing automatic rewrites from: (##! ok_result! exception_result! fatal_result! raise_fault! is_leaf?! bus_width! pe_size! bits_per_level! base! paging_tape?! pdir_entry?! ptab_entry?! max_level!)

Expanding the definition of paging_type?,

Expanding the definition of pdir_entry?,

Expanding the definition of ptab_entry?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `translate_result_leaf`.

Q.E.D.

C.114.17 Linear_Memory.translate_result_no_leaf_TCC1

Terse proof for `translate_result_no_leaf_TCC1`.

`translate_result_no_leaf_TCC1`:

{1} ∀ (lvl: Level, base, addr: Memory_Address_4G, access: Memory_access, priv: Memory_privilege,
s: Linear_memory):
aligned?(bits_per_level + pe_size)(offset(base)) ∧
OK?(translate(lvl, base, addr, access, priv)(s)) ∧
¬ data(translate(lvl, base, addr, access, priv)(s))`1
⊃
offset
(data[Physical_memory, [bool, Address]]
(translate(lvl, base, addr, access, priv)(s))`2)
≥ 0

Repeatedly Skolemizing and flattening,

Using lemma translate_memory_address2,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `translate_result_no_leaf_TCC1`.

Q.E.D.

C.114.18 Linear_Memory.translate_result_no_leaf

Terse proof for `translate_result_no_leaf`.

`translate_result_no_leaf`:

{1} ∀ (lvl: Level, base, addr: Memory_Address_4G, access: Memory_access, priv: Memory_privilege,
s: Linear_memory):
aligned?(bits_per_level + pe_size)(offset(base)) ∧
OK?(translate(lvl, base, addr, access, priv)(s)) ∧
¬ data(translate(lvl, base, addr, access, priv)(s))‘1
⊃
aligned?(bits_per_level + pe_size)
(offset(data(translate(lvl, base, addr, access, priv)(s))‘2))

Repeatedly Skolemizing and flattening,

Expanding the definition of translate,

Installing automatic rewrites from: (##! ok_result! exception_result! fatal_result! raise_fault! is_leaf?! bus_width! pe_size! bits_per_level! base! paging_tape?! pdir_entry?! ptab_entry?! max_level!)

Expanding the definition of paging_type?,

Expanding the definition of pdir_entry?,

Expanding the definition of ptab_entry?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `translate_result_no_leaf`.

Q.E.D.

C.114.19 Linear_Memory.linear_resolve_TCC1

Terse proof for `linear_resolve_TCC1`.

`linear_resolve_TCC1`:

{1} ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
priv = segment_to_priv(cs) ⊃
(∀ (pdbr: Pdbr_type, lvl: nat): lvl = pdir_lvl ⊃ lvl < max_level)

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `linear_resolve_TCC1`.

Q.E.D.

C.114.20 Linear_Memory.linear_resolve_TCC2

Terse proof for `linear_resolve_TCC2`.

`linear_resolve_TCC2:`

```
{1}  ∀ (addr: Memory_Address_4G, access: Memory_access, cs: Segment_Reg_type,
          priv: Memory_privilege):
       priv = segment_to_priv(cs) ⊃
        (∀ (pdbr: Pdbr_type, lvl: nat):
            lvl = pdir_lvl ⊃
             (∀ (x1: Physical_memory):
                 every[Physical_memory, [bool, Address]]

                        λ (t: [bool, Address]):
                          Mem?(t`2`type_of) ∧
                           (0 ≤ t`2`offset ∧ t`2`offset < max_linear_offset) ∧
                            IF t`1
                               THEN aligned?(−1 × lvl × bits_per_level − bits_per_level + bus_width)
                                             (offset(t`2))
                            ELSE aligned?(bits_per_level + pe_size)(offset(t`2))
                            ENDIF)
                      (translate(lvl, pdbr`base_addr, addr, access, priv)(x1))))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Using lemma translate_result_leaf,
Using lemma translate_result_no_leaf,
Using lemma translate_memory_address,
Using lemma translate_memory_address2,
Installing automatic rewrites from: max_linear Mem < bits_per_level pe_size
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_TCC2`.
Q.E.D.

C.114.21 Linear_Memory.linear_resolve_TCC3

Terse proof for `linear_resolve_TCC3`.

`linear_resolve_TCC3:`

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
       priv = segment_to_priv(cs) ⊃
        (∀ (pdbr: Pdbr_type, lvl: nat):
            lvl = pdir_lvl ⊃ (∀ (leaf: bool, b: Memory_Address_4G): leaf ⊃ off-
     set(b) ≥ 0))
```

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: bus_width bits_per_level max_level
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_TCC3`.
Q.E.D.

C.114.22 Linear_Memory.linear_resolve_TCC4

Terse proof for `linear_resolve_TCC4`.

`linear_resolve_TCC4`:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
       priv = segment_to_priv(cs) ⊃
        (∀ (pdbr: Pdbr_type, lvl: nat):
             lvl = pdir_lvl ⊃
              (∀ (leaf: bool, b: Memory_Address_4G):
                   leaf ⊃ bus_width − bits_per_level × (lvl + 1) ≥ 0))
```

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: bus_width bits_per_level max_level pdir_lvl
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `linear_resolve_TCC4`.
Q.E.D.

C.114.23 Linear_Memory.linear_resolve_TCC5

Terse proof for `linear_resolve_TCC5`.

`linear_resolve_TCC5`:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
       priv = segment_to_priv(cs) ⊃
        (∀ (pdbr: Pdbr_type, lvl: nat):
             lvl = pdir_lvl ⊃
              (∀ (leaf: bool, b: Memory_Address_4G): ¬ leaf ⊃ offset(b) ≥ 0))
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_TCC5`.
Q.E.D.

C.114.24 Linear_Memory.linear_resolve_TCC6

Terse proof for `linear_resolve_TCC6`.

`linear_resolve_TCC6`:

```
{1}  ∀ (addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
       priv = segment_to_priv(cs) ⊃
        (∀ (pdbr: Pdbr_type, lvl: nat):
             lvl = pdir_lvl ⊃
              (∀ (leaf: bool,
                  base:
                    {b: Memory_Address_4G |
                                IF leaf
                                  THEN aligned?(bus_width − bits_per_level × (lvl + 1))
                                                (offset(b))
                                ELSE aligned?(bits_per_level + pe_size)(offset(b))
                                ENDIF}):
                 ¬ leaf ⊃ (∀ (lvl1: nat): lvl1 = ptab_lvl ⊃ lvl1 < max_level)))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `linear_resolve_TCC6`.

Q.E.D.

C.114.25 Linear_Memory.linear_resolve_TCC7

Terse proof for `linear_resolve_TCC7`.

`linear_resolve_TCC7`:

{1} ∀ (addr: Memory_Address_4G, access: Memory_access, cs: Segment_Reg_type,
priv: Memory_privilege):
priv = segment_to_priv(cs) ⊃
(∀ (pdbr: Pdbr_type, lvl: nat):
lvl = pdir_lvl ⊃
(∀ (leaf: bool,
base:
{b: Memory_Address_4G |
IF leaf

λ (t: [bool, Address]):
Mem?(t‘2‘type_of) ∧
0 ≤ t‘2‘offset ∧ t‘2‘offset < max_linear_offset)
(translate(lvl1, base, addr, access, priv)(x_1))))))

Repeatedly Skolemizing and flattening,

Expanding the definition of every,

Using lemma translate_memory_address,

Using lemma translate_memory_address2,

Installing automatic rewrites from: max_linear Mem < bits_per_level pe_size

Using lemma translate_result_leaf,

Using lemma translate_result_no_leaf,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `linear_resolve_TCC7`.

Q.E.D.

C.114.26 Linear_Memory.linear_resolve_TCC8

Terse proof for `linear_resolve_TCC8`.

`linear_resolve_TCC8`:

{1} ∀ (leaf: bool, addr: Memory_Address_4G, cs: Segment_Reg_type, priv: Memory_privilege):
priv = segment_to_priv(cs) ⊃
(∀ (pdbr: Pdbr_type, lvl: nat):
lvl = pdir_lvl ⊃
(∀ (*b*: Memory_Address_4G):
leaf ⊃
−1 × lvl × bits_per_level − bits_per_level + bus_width ≥ 0))

Repeatedly Skolemizing and flattening,

Keeping (-9 1) and hiding *,

Installing automatic rewrites from: bus_width

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `linear_resolve_TCC8`.

Q.E.D.

C.114.27 Linear_Memory.linear_resolve_memory_address

Terse proof for `linear_resolve_memory_address`.

`linear_resolve_memory_address`:

{1} ∀ (access: Memory_access, addr: Memory_Address_4G, x_1: Linear_memory):
every[Linear_memory, Address]
(λ (*x*: Linear_memory): TRUE,
λ (*x*: Address):
Mem?(*x*`type_of) ∧ 0 ≤ *x*`offset ∧ *x*`offset < max_linear_offset)
(linear_resolve(addr, access)(x_1))

Repeatedly Skolemizing and flattening,

Expanding the definition of every,

Expanding the definition of linear_resolve,

Expanding the definition of ##,

Expanding the definition of ok_result,

Installing automatic rewrites from: max_linear Mem < bits_per_level bus_width min_linear Address_Helpers.<= max_level pe_size xlat_ofs_memory_address! pdir_lvl ptab_lvl translate_result_leaf translate_result_no_leaf translate_memory_address! translate_memory_address2! xlat_ofs_memory_address2! translate_result_leaf translate_result_no_leaf

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 6 subgoals:

`linear_resolve_memory_address.1`:

{-1} Mem?(addr′`type_of)
{-2} $0 \leq$ addr′`offset
{-3} addr′`offset $<$ max_linear_offset
{-4} OK?(read_data(pm, segment_reg_data_type)(CS)(x_1'))

(state(read_data(pm, pdbr_data_type)(PDBR)
(state(read_data(pm, segment_reg_data_type)(CS)
(x_1'))))))‘1
{2} Mem?(xlat_ofs(1,

Using lemma translate_result_no_leaf,
Using lemma translate_result_leaf,
Using lemma translate_result_no_leaf,
Using lemma translate_memory_address,
Using lemma xlat_ofs_memory_address,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_memory_address.6`.
Q.E.D.

C.114.28 Linear_Memory.linear_read_TCC1

Terse proof for `linear_read_TCC1`.
`linear_read_TCC1`:

{1} Mem?(min_linear‘type_of)

Expanding the definition of min_linear,
Rewriting using Mem, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `linear_read_TCC1`.
Q.E.D.

C.114.29 Linear_Memory.linear_read_TCC2

Terse proof for `linear_read_TCC2`.
`linear_read_TCC2`:

{1} Mem?(max_linear‘type_of)

Expanding the definition of max_linear,
Expanding the definition of Mem,
which is trivially true.
This completes the proof of `linear_read_TCC2`.
Q.E.D.

C.114.30 Linear_Memory.linear_read_TCC3

Terse proof for `linear_read_TCC3`.
`linear_read_TCC3`:

{1} $\forall$ (a: Address):
Mem?(type_of(a)) $\wedge$ in_memory(min_linear, max_linear)(a) $\supset$
$0 \leq a$‘offset $\wedge$ a‘offset $<$ max_linear_offset

Expanding the definition of min_linear,
Trying repeated skolemization, instantiation, and if-lifting,
Expanding the definition of max_linear,
Expanding the definition of max_linear_offset,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_read_TCC3`.
Q.E.D.

C.114.31 Linear_Memory.linear_read_side_effect_TCC1

Terse proof for `linear_read_side_effect_TCC1`.

`linear_read_side_effect_TCC1`:

```
{1}  ∀ (a: Address, bl: list[Byte], s: Linear_memory):
       Mem?(type_of(a)) ∧
        (null?(bl) ∨
           (reg_base(min_linear)(type_of(a)) ≤ a ∧
              a + length(bl) ≤ reg_size(max_linear)(type_of(a))))
        ⊃
        every[[Address, list[Byte]]]
             (λ (t: [Address, list[Byte]]):
                Mem?(t`1`type_of) ∧ 0 ≤ t`1`offset ∧ t`1`offset < max_linear_offset)
             (split(min_page, a, bl))
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Case splitting on bl!1 = null,
we get 2 subgoals:

`linear_read_side_effect_TCC1.1`:

```
{-1}  bl′ = null
{-2}  Mem?(type_of(a′))
{-3}  null?(bl′) ∨
        (reg_base(min_linear)(type_of(a′)) ≤ a′ ∧
           a′ + length(bl′) ≤ reg_size(max_linear)(type_of(a′)))
------------------------------------------------------------------
{1}   every[[Address, list[Byte]]]
           (λ (t: [Address, list[Byte]]):
              Mem?(t`1`type_of) ∧ 0 ≤ t`1`offset ∧ t`1`offset < max_linear_offset)
           (split(min_page, a′, bl′))
```

Using lemma split_null,
Expanding the definition of every,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `linear_read_side_effect_TCC1.1`.

`linear_read_side_effect_TCC1.2`:

```
{-1}  Mem?(type_of(a′))
{-2}  null?(bl′) ∨
        (reg_base(min_linear)(type_of(a′)) ≤ a′ ∧
           a′ + length(bl′) ≤ reg_size(max_linear)(type_of(a′)))
------------------------------------------------------------------
{1}   bl′ = null
{2}   every[[Address, list[Byte]]]
           (λ (t: [Address, list[Byte]]):
              Mem?(t`1`type_of) ∧ 0 ≤ t`1`offset ∧ t`1`offset < max_linear_offset)
           (split(min_page, a′, bl′))
```

Using lemma split_range,
Using lemma split_no_null,
Using lemma every_implied,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

`linear_read_side_effect_TCC1.2.1:`

```
{-1}  cons?(bl')
{-2}  every(λ (a2: Address, bl2: list[Byte]): cons?(bl2))(split(min_page, a', bl'))
{-3}  every(λ (a2: Address, bl2: list[Byte]):
                a' ≤ a2 ∧ a2 + length(bl2) ≤ a' + length(bl'))
           (split(min_page, a', bl'))
{-4}  Mem?(type_of(a'))
{-5}  reg_base(min_linear)(type_of(a')) ≤ a'
{-6}  a' + length(bl') ≤ reg_size(max_linear)(type_of(a'))
|-------
{1}   every((λ (a2: Address, bl2: list[Byte]):
                 cons?(bl2) ∧ a' ≤ a2 ∧ a2 + length(bl2) ≤ a' + length(bl')))
           (split(min_page, a', bl'))
{2}   every[[Address, list[Byte]]]
           (λ (t: [Address, list[Byte]]):
                Mem?(t`1`type_of) ∧ 0 ≤ t`1`offset ∧ t`1`offset < max_linear_offset)
           (split(min_page, a', bl'))
```

Hiding formulas: 2,

Using lemma every_conjunct_left,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `linear_read_side_effect_TCC1.2.1`.

`linear_read_side_effect_TCC1.2.2:`

```
{-1}  cons?(bl')
{-2}  every(λ (a2: Address, bl2: list[Byte]): cons?(bl2))(split(min_page, a', bl'))
{-3}  every(λ (a2: Address, bl2: list[Byte]):
                a' ≤ a2 ∧ a2 + length(bl2) ≤ a' + length(bl'))
           (split(min_page, a', bl'))
{-4}  Mem?(type_of(a'))
{-5}  reg_base(min_linear)(type_of(a')) ≤ a'
{-6}  a' + length(bl') ≤ reg_size(max_linear)(type_of(a'))
|-------
{1}   ∀ (t_1: [Address, list[Byte]]):
        cons?(t_1`2) ∧ a' ≤ t_1`1 ∧ t_1`1 + length(t_1`2) ≤ a' + length(bl')
          ⊃ Mem?(t_1`1`type_of) ∧ 0 ≤ t_1`1`offset ∧ t_1`1`offset < max_linear_offset
{2}   every[[Address, list[Byte]]]
           (λ (t: [Address, list[Byte]]):
                Mem?(t`1`type_of) ∧ 0 ≤ t`1`offset ∧ t`1`offset < max_linear_offset)
           (split(min_page, a', bl'))
```

Hiding formulas: (-2 -3 2),

Trying repeated skolemization, instantiation, and if-lifting,

Expanding the definition of max_linear,

Expanding the definition of Mem,

Expanding the definition of max_linear_offset,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `linear_read_side_effect_TCC1.2.2`.

Q.E.D.

C.115 Proofs for Linear_Memory_Blessing (challenge-linear.pvs)

C.115.1 Linear_Memory_Blessing.PTab_Address_TCC1

Terse proof for `PTab_Address_TCC1`.

`PTab_Address_TCC1`:

{1} ∀ (a: Memory_Address_4G): offset(a) ≥ 0

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `PTab_Address_TCC1`.
Q.E.D.

C.115.2 Linear_Memory_Blessing.pe_in_pdir_range?_TCC1

Terse proof for `pe_in_pdir_range?_TCC1`.

`pe_in_pdir_range?_TCC1`:

{1} ∀ (s: Linear_memory[Physical_memory, pm_phy], linear_range: PRED[Memory_Address_4G],
phy_a: Memory_Address_4G, res: ExprResult[Physical_memory, Pdbr_type]):
OK?(res) ∧ res = read_data(pm_phy, pdbr_data_type)(PDBR)(s) ⊃
(∀ (lin_a: (linear_range)): pdir_lvl[Physical_memory, pm_phy] < max_level)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pe_in_pdir_range?_TCC1`.
Q.E.D.

C.115.3 Linear_Memory_Blessing.pe_in_ptab_range?_TCC1

Terse proof for `pe_in_ptab_range?_TCC1`.

`pe_in_ptab_range?_TCC1`:

{1} ∀ (s: Linear_memory[Physical_memory, pm_phy], linear_range: PRED[Memory_Address_4G],
phy_a: Memory_Address_4G, pde: (pe_in_pdir_range?(s, linear_range)),
lin_a: (linear_range)):
pdir_lvl[Physical_memory, pm_phy] < max_level

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pe_in_ptab_range?_TCC1`.
Q.E.D.

C.115.4 Linear_Memory_Blessing.pe_in_ptab_range?_TCC2

Terse proof for `pe_in_ptab_range?_TCC2`.

pe_in_ptab_range?_TCC2:

```
{1}  ∀ (s: Linear_memory[Physical_memory, pm_phy], linear_range: PRED[Memory_Address_4G],
          phy_a: Memory_Address_4G, pde: (pe_in_pdir_range?(s, linear_range)),
          lin_a: (linear_range),
          res: ExprResult[Physical_memory, ((range_pt(pdir_lvl[Physical_memory, pm_phy])))]):
       OK?(res) ∧ res = read_data(pm_phy, paging_data_type(pdir_lvl))(pde)(s) ⊃
        pdir?(data[Physical_memory, ((range_pt(pdir_lvl)))](res))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for data[Physical_memory, ((range_pt(pdir_lvl)))](res!1),
Expanding the definition of range_pt,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of pdir_lvl,
which is trivially true.
This completes the proof of pe_in_ptab_range?_TCC2.
Q.E.D.

C.115.5 Linear_Memory_Blessing.pe_in_ptab_range?_TCC3

Terse proof for pe_in_ptab_range?_TCC3.
pe_in_ptab_range?_TCC3:

```
{1}  ∀ (s: Linear_memory[Physical_memory, pm_phy], linear_range: PRED[Memory_Address_4G],
          phy_a: Memory_Address_4G, pde: (pe_in_pdir_range?(s, linear_range)),
          lin_a: (linear_range),
          res: ExprResult[Physical_memory, ((range_pt(pdir_lvl[Physical_memory, pm_phy])))]):
       pde_pt?(pdir(data(res))) ∧
        OK?(res) ∧ res = read_data(pm_phy, paging_data_type(pdir_lvl))(pde)(s)
        ⊃ ptab_lvl[Physical_memory, pm_phy] < max_level
```

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pe_in_ptab_range?_TCC3.
Q.E.D.

C.115.6 Linear_Memory_Blessing.pe_in_ptab_range?_TCC4

Terse proof for pe_in_ptab_range?_TCC4.
pe_in_ptab_range?_TCC4:

```
{1}  ∀ (s: Linear_memory[Physical_memory, pm_phy], linear_range: PRED[Memory_Address_4G],
          phy_a: Memory_Address_4G, pde: (pe_in_pdir_range?(s, linear_range)),
          lin_a: (linear_range),
          res: ExprResult[Physical_memory, ((range_pt(pdir_lvl[Physical_memory, pm_phy])))]):
       pde_pt?(pdir(data(res))) ∧
        OK?(res) ∧ res = read_data(pm_phy, paging_data_type(pdir_lvl))(pde)(s)
        ⊃ present?(data[Physical_memory, ((range_pt(pdir_lvl)))](res))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of present?,

Adding type constraints for data(res!1),
Expanding the definition of range_pt,
Expanding the definition of pdir_lvl,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pe_in_ptab_range?_TCC4`.
Q.E.D.

C.115.7 Linear_Memory_Blessing.pe_in_pt_range?_TCC1

Terse proof for `pe_in_pt_range?_TCC1`.
`pe_in_pt_range?_TCC1`:

{1} ∀ (s: Linear_memory[Physical_memory, pm_phy], lvl: Level, phy_a: Memory_Address_4G):
¬ (lvl = pdir_lvl[Physical_memory, pm_phy] ∧ lvl = ptab_lvl[Physical_memory, pm_phy])

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pe_in_pt_range?_TCC1`.
Q.E.D.

C.115.8 Linear_Memory_Blessing.pe_in_pt_range?_TCC2

Terse proof for `pe_in_pt_range?_TCC2`.
`pe_in_pt_range?_TCC2`:

{1} ∀ (s: Linear_memory[Physical_memory, pm_phy], lvl: Level, phy_a: Memory_Address_4G):
lvl = pdir_lvl[Physical_memory, pm_phy] ∨ lvl = ptab_lvl[Physical_memory, pm_phy]

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pe_in_pt_range?_TCC2`.
Q.E.D.

C.115.9 Linear_Memory_Blessing.pe_in_pt_range_aligned

Terse proof for `pe_in_pt_range_aligned`.
`pe_in_pt_range_aligned`:

{1} ∀ (linear_range: PRED[Memory_Address_4G], lvl: Level,
s: Linear_memory[Physical_memory, pm_phy], phy_a: Memory_Address_4G):
pe_in_pt_range?(s, linear_range, lvl)(phy_a) ⊃ aligned?(pe_size)(offset(phy_a))

Expanding the definition of pe_in_pt_range?,
Expanding the definition of pe_in_ptab_range?,
Expanding the definition of pe_in_pdir_range?,
Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: pe_size bits_per_level xlat_idx_pe_aligned
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

`pe_in_pt_range_aligned.1`:

{-1} $\mathrm{lvl}' < \mathrm{max\_level}$
{-2} Mem?(phy_a′‘type_of)
{-3} $0 \leq$ phy_a′‘offset
{-4} phy_a′‘offset $<$ max_linear_offset
{-5} $\mathrm{lvl}' = \mathrm{pdir\_lvl}$
{-6} OK?(read_data(pm_phy, pdbr_data_type)(PDBR)(s'))
{-7} $\exists$ (lin_a: (linear_range′)):
xlat_idx(pdir_lvl, data(read_data(pm_phy, pdbr_data_type)(PDBR)(s'))‘base_addr, lin_a)
$=$ phy_a′

{1} aligned?(2)(offset(phy_a′))

Repeatedly Skolemizing and flattening,
Adding type constraints for (data(read_data(pm_phy, pdbr_data_type)(PDBR)(s!1))‘base_addr),
Using lemma xlat_idx_pe_aligned,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pe_in_pt_range_aligned.1`.
`pe_in_pt_range_aligned.2`:

{-1} $\mathrm{lvl}' < \mathrm{max\_level}$
{-2} Mem?(phy_a′‘type_of)
{-3} $0 \leq$ phy_a′‘offset
{-4} phy_a′‘offset $<$ max_linear_offset
{-5} $\exists$ (pde: (pe_in_pdir_range?(s', linear_range′))):
$\exists$ (lin_a: (linear_range′)):
OK?(read_data(pm_phy, paging_data_type(pdir_lvl))(pde)(s')) $\wedge$
pde_pt?(pdir(data(read_data(pm_phy, paging_data_type(pdir_lvl))(pde)(s')))) $\wedge$
xlat_idx(ptab_lvl,
base(data(read_data(pm_phy, paging_data_type(pdir_lvl))(pde)(s'))),
lin_a)
$=$ phy_a′

{1} $\mathrm{lvl}' = \mathrm{pdir\_lvl}$
{2} aligned?(2)(offset(phy_a′))

Repeatedly Skolemizing and flattening,
Using lemma xlat_idx_pe_aligned,
Expanding the definition of base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pe_in_pt_range_aligned.2`.
Q.E.D.

C.115.10 Linear_Memory_Blessing.pe_in_pt_address_in_pt

Terse proof for `pe_in_pt_address_in_pt`.
`pe_in_pt_address_in_pt`:

{1} $\forall$ (linear_range: PRED[Memory_Address_4G], lvl: Level,
s: Linear_memory[Physical_memory, pm_phy], base: Memory_Address_4G):
pe_in_pt_range?(s, linear_range, lvl)(base) $\supset$
(address_block(base, expt(2, pe_size)) $\subseteq$ extend [Address, Memory_Address_4G, bool, FALSE](address_i

Repeatedly Skolemizing and flattening,
Expanding the definition of subset?,

Expanding the definition of member,
Repeatedly Skolemizing and flattening,
Expanding the definition of address_in_pt_range?,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 4 subgoals:
`pe_in_pt_address_in_pt.1:`

{-1} $\mathrm{lvl}' < \mathrm{max\_level}$
{-2} $\mathrm{Mem?}(\mathrm{base}'\text{`}\mathrm{type\_of})$
{-3} $0 \leq \mathrm{base}'\text{`}\mathrm{offset}$
{-4} $\mathrm{base}'\text{`}\mathrm{offset} < \mathrm{max\_linear\_offset}$
{-5} $\mathrm{pe\_in\_pt\_range?}(s', \mathrm{linear\_range}', \mathrm{lvl}')(\mathrm{base}')$
{-6} $\mathrm{address\_block}(\mathrm{base}', \mathrm{expt}(2, \mathrm{pe\_size}))(x')$

{1} $\exists\ (\mathrm{pe}: \mathrm{Memory\_Address\_4G}, \mathrm{lvl}: \mathrm{Level}):$
$\mathrm{pe\_in\_pt\_range?}(s', \mathrm{linear\_range}', \mathrm{lvl})(\mathrm{pe}) \wedge$
$\mathrm{address\_block}(\mathrm{pe}, \mathrm{expt}(2, \mathrm{pe\_size}))(x')$

Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pe_in_pt_address_in_pt.1`.
`pe_in_pt_address_in_pt.2:`

{-1} $\mathrm{lvl}' < \mathrm{max\_level}$
{-2} $\mathrm{Mem?}(\mathrm{base}'\text{`}\mathrm{type\_of})$

{-4} $\mathrm{base}'\text{`}\mathrm{offset} < \mathrm{max\_linear\_offset}$
{-5} $\mathrm{pe\_in\_pt\_range?}(s', \mathrm{linear\_range}', \mathrm{lvl}')(\mathrm{base}')$
{-6} $\mathrm{address\_block}(\mathrm{base}', \mathrm{expt}(2, \mathrm{pe\_size}))(x')$

{1} $x'\text{`}\mathrm{offset} < \mathrm{max\_linear\_offset}$

Using lemma pe_in_pt_range_aligned,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of address_block,
Applying disjunctive simplification to flatten sequent,
Using lemma aligned_add_below,
we get 2 subgoals:
`pe_in_pt_address_in_pt.2.1:`

{-1} $\mathrm{pe\_size} \leq \mathrm{bus\_width} \wedge$
$\mathrm{offset}(\mathrm{base}') < \mathrm{expt}(2, \mathrm{bus\_width}) \wedge$
$\mathrm{aligned?}(\mathrm{pe\_size})(\mathrm{offset}(\mathrm{base}')) \wedge \mathrm{expt}(2, \mathrm{pe\_size}) - 1 < \mathrm{expt}(2, \mathrm{pe\_size})$
$\supset \mathrm{offset}(\mathrm{base}') + \mathrm{expt}(2, \mathrm{pe\_size}) - 1 < \mathrm{expt}(2, \mathrm{bus\_width})$
{-2} $\mathrm{pe\_in\_pt\_range?}(s', \mathrm{linear\_range}', \mathrm{lvl}')(\mathrm{base}')$
{-3} $\mathrm{aligned?}(\mathrm{pe\_size})(\mathrm{offset}(\mathrm{base}'))$
{-4} $\mathrm{lvl}' < \mathrm{max\_level}$
{-5} $\mathrm{Mem?}(\mathrm{base}'\text{`}\mathrm{type\_of})$
{-6} $0 \leq \mathrm{base}'\text{`}\mathrm{offset}$
{-7} $\mathrm{base}'\text{`}\mathrm{offset} < \mathrm{max\_linear\_offset}$
{-8} $\mathrm{type\_of}(\mathrm{base}') = \mathrm{type\_of}(x')$
{-9} $\mathrm{offset}(x') < \mathrm{offset}(\mathrm{base}') + \mathrm{expt}(2, \mathrm{pe\_size})$

{1} $x'\text{`}\mathrm{offset} < \mathrm{max\_linear\_offset}$

Installing automatic rewrites from: (max_linear_offset! bus_width! pe_size!)
Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pe_in_pt_address_in_pt.2.1`.

`pe_in_pt_address_in_pt.2.2`:

{-1}	pe_in_pt_range?(s', linear_range$'$, lvl$'$)(base$'$)
{-2}	aligned?(pe_size)(offset(base$'$))
{-3}	lvl$'$ $<$ max_level
{-4}	Mem?(base$'$`type_of)
{-5}	$0 \leq$ base$'$`offset
{-6}	base$'$`offset $<$ max_linear_offset
{-7}	type_of(base$'$) $=$ type_of(x')
{-8}	offset(x') $<$ offset(base$'$) + expt(2, pe_size)
{1}	expt(2, pe_size) $-$ 1 $\geq$ 0
{2}	x'`offset $<$ max_linear_offset

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pe_in_pt_address_in_pt.2.2`.

`pe_in_pt_address_in_pt.3`:

{-1}	lvl$'$ $<$ max_level
{-2}	Mem?(base$'$`type_of)
{-3}	$0 \leq$ base$'$`offset
{-4}	base$'$`offset $<$ max_linear_offset
{-5}	pe_in_pt_range?(s', linear_range$'$, lvl$'$)(base$'$)
{-6}	address_block(base$'$, expt(2, pe_size))(x')
{1}	$0 \leq$ x'`offset

Expanding the definition of address_block,

which is trivially true.

This completes the proof of `pe_in_pt_address_in_pt.3`.

`pe_in_pt_address_in_pt.4`:

{-1}	lvl$'$ $<$ max_level
{-2}	Mem?(base$'$`type_of)
{-3}	$0 \leq$ base$'$`offset
{-4}	base$'$`offset $<$ max_linear_offset
{-5}	pe_in_pt_range?(s', linear_range$'$, lvl$'$)(base$'$)
{-6}	address_block(base$'$, expt(2, pe_size))(x')
{1}	Mem?(x'`type_of)

Expanding the definition of address_block,

which is trivially true.

This completes the proof of `pe_in_pt_address_in_pt.4`.

```

Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of apply_side_effects,
Expanding the definition of ok_result,
Expanding the definition of reduce,

Using lemma split_null,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `linear_plain_unchanged_memory_invariant.2.1.3.1.1`.

Q.E.D.

C.116.9 Linear_Memory_Blessing_Properties.linear_memory_plain_memory

Terse proof for `linear_memory_plain_memory`.
`linear_memory_plain_memory:`

{1} ∀ (pm: Plain_Memory⌊Physical_memory⌋): is_linear_plain_memory?(pm) ⊃ plain_memory?(pm)

Expanding the definition of plain_memory?,
Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: (linear_plain_transformers_ok! linear_plain_unchanged_memory_invariant! linear_plain_unchanged_memory_invariant_write! linear_plain_unchanged_memory_write_invariant! linear_plain_changed_memory_invariant! linear_plain_read_side_effect_unchanged! linear_plain_write_side_effect_uncha
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `linear_memory_plain_memory`.
Q.E.D.

C.117 Proofs for Linear_Memory_Properties (challenge-linear.pvs)

C.117.1 Linear_Memory_Properties.pm_read_linear

Terse proof for `pm_read_linear`.
`pm_read_linear`:

{1} ∀ (pm: Plain_Memory[Linear_memory], a: Address):
is_linear_plain_memory?(pm) ⊃ memory_read(pm`mem)(a) = linear_read(a)

Repeatedly Skolemizing and flattening,
Expanding the definition of is_linear_plain_memory?,
Applying disjunctive simplification to flatten sequent,
Expanding the definition of linear_pm,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_read_linear`.
Q.E.D.

C.117.2 Linear_Memory_Properties.pm_write_linear

Terse proof for `pm_write_linear`.
`pm_write_linear`:

{1} ∀ (pm: Plain_Memory[Linear_memory], a: Address, b: Byte):
is_linear_plain_memory?(pm) ⊃ memory_write(pm`mem)(a, b) = linear_write(a, b)

Repeatedly Skolemizing and flattening,
Expanding the definition of is_linear_plain_memory?,
Applying disjunctive simplification to flatten sequent,
Replacing using formula -2,
Expanding the definition of linear_pm,
which is trivially true.
This completes the proof of `pm_write_linear`.
Q.E.D.

C.117.3 Linear_Memory_Properties.pm_read_side_effect_linear

Terse proof for `pm_read_side_effect_linear`.
`pm_read_side_effect_linear`:

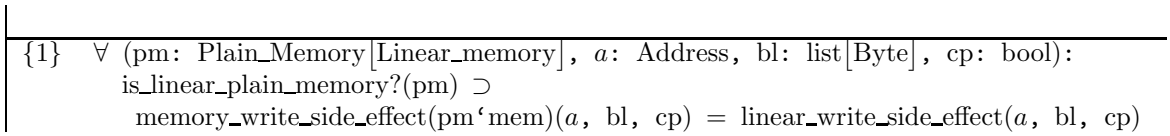
{1} ∀ (pm: Plain_Memory[Linear_memory], a: Address, bl: list[Byte], cp: bool):
is_linear_plain_memory?(pm) ⊃
memory_read_side_effect(pm`mem)(a, bl, cp) = linear_read_side_effect(a, bl, cp)

Repeatedly Skolemizing and flattening,

Expanding the definition of is_linear_plain_memory?,
Applying disjunctive simplification to flatten sequent,
Replacing using formula -2,
Expanding the definition of linear_pm,
which is trivially true.
This completes the proof of `pm_read_side_effect_linear`.
Q.E.D.

C.117.4 Linear_Memory_Properties.pm_write_side_effect_linear

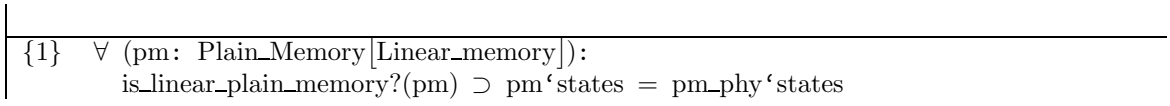
Terse proof for `pm_write_side_effect_linear`.
`pm_write_side_effect_linear:`



Repeatedly Skolemizing and flattening,
Expanding the definition of is_linear_plain_memory?,
Expanding the definition of linear_pm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_write_side_effect_linear`.
Q.E.D.

C.117.5 Linear_Memory_Properties.pm_states

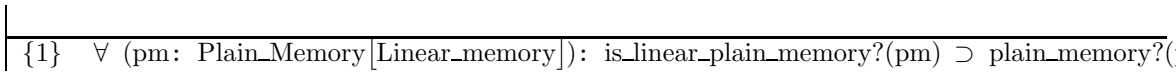
Terse proof for `pm_states`.
`pm_states:`



Expanding the definition of is_linear_plain_memory?,
Repeatedly Skolemizing and flattening,
This completes the proof of `pm_states`.
Q.E.D.

C.117.6 Linear_Memory_Properties.pm_plain_phy

Terse proof for `pm_plain_phy`.
`pm_plain_phy:`

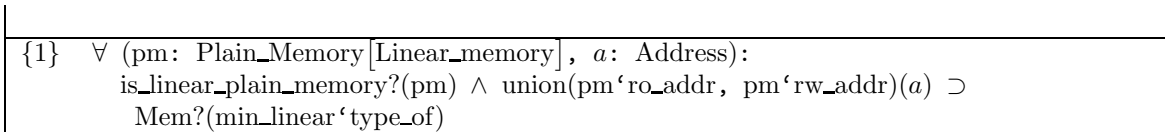


Repeatedly Skolemizing and flattening,
Expanding the definition of is_linear_plain_memory?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_plain_phy`.
Q.E.D.

C.117.7 Linear_Memory_Properties.pm_memory_addr_TCC1

Terse proof for `pm_memory_addr_TCC1`.

`pm_memory_addr_TCC1`:

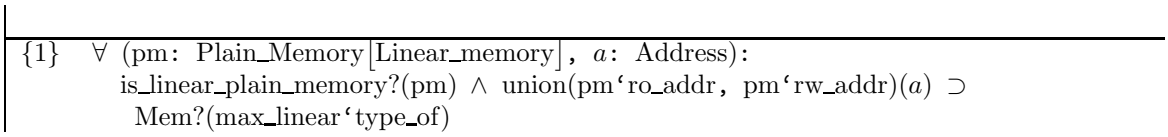


Repeatedly Skolemizing and flattening,
Expanding the definition of min_linear,
Expanding the definition of Mem,
which is trivially true.
This completes the proof of `pm_memory_addr_TCC1`.
Q.E.D.

C.117.8 Linear_Memory_Properties.pm_memory_addr_TCC2

Terse proof for `pm_memory_addr_TCC2`.

`pm_memory_addr_TCC2`:

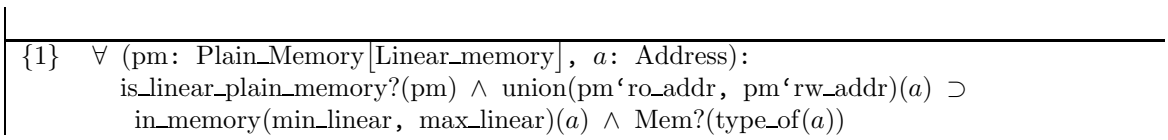


Repeatedly Skolemizing and flattening,
Expanding the definition of max_linear,
Expanding the definition of Mem,
which is trivially true.
This completes the proof of `pm_memory_addr_TCC2`.
Q.E.D.

C.117.9 Linear_Memory_Properties.pm_memory_addr

Terse proof for `pm_memory_addr`.

`pm_memory_addr`:



Expanding the definition of is_linear_plain_memory?,
Repeatedly Skolemizing and flattening,
Expanding the definition of max_linear,
Expanding the definition of Mem,
Instantiating quantified variables,
Keeping (-13 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pm_memory_addr`.
Q.E.D.

C.117.10 Linear_Memory_Properties.pm_linear_blessed

Terse proof for `pm_linear_blessed`.
`pm_linear_blessed:`

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], s: Linear_memory[Physical_memory, pm_phy]):
       is_linear_plain_memory?(pm) ∧ pm`states(s) ⊃
         linear_blessed?(s, restrict[Address, Memory_Address_4G, boolean](pm`ro_addr),
                            restrict[Address, Memory_Address_4G, boolean](pm`rw_addr))
```

Expanding the definition of is_linear_plain_memory?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
This completes the proof of `pm_linear_blessed`.
Q.E.D.

C.117.11 Linear_Memory_Properties.pm_linear_resolve_read_ok_TCC1

Terse proof for `pm_linear_resolve_read_ok_TCC1`.
`pm_linear_resolve_read_ok_TCC1:`

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], s: (pm`states),
          a: ((pm`ro_addr ∪ pm`rw_addr))):
       is_linear_plain_memory?(pm) ⊃
         Mem?(a`type_of) ∧ 0 ≤ a`offset ∧ a`offset < max_linear_offset
```

Repeatedly Skolemizing and flattening,
Expanding the definition of is_linear_plain_memory?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
This completes the proof of `pm_linear_resolve_read_ok_TCC1`.
Q.E.D.

C.117.12 Linear_Memory_Properties.pm_linear_resolve_read_ok

Terse proof for `pm_linear_resolve_read_ok`.
`pm_linear_resolve_read_ok:`

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], s: (pm`states),
          a: ((pm`ro_addr ∪ pm`rw_addr))):
       is_linear_plain_memory?(pm) ⊃ OK?(linear_resolve(a, Read)(s))
```

Repeatedly Skolemizing and flattening,
Using lemma pm_linear_blessed,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of linear_blessed?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (-9 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pm_linear_resolve_read_ok`.
Q.E.D.

C.117.13 Linear_Memory_Properties.pm_linear_resolve_write_ok_TCC1

Terse proof for `pm_linear_resolve_write_ok_TCC1`.
`pm_linear_resolve_write_ok_TCC1`:

{1} ∀ (pm: Plain_Memory[Linear_memory], s: (pm‘states), a: (pm‘rw_addr)):
is_linear_plain_memory?(pm) ⊃
Mem?(a‘type_of) ∧ 0 ≤ a‘offset ∧ a‘offset < max_linear_offset

Expanding the definition of is_linear_plain_memory?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Keeping (-1 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pm_linear_resolve_write_ok_TCC1`.
Q.E.D.

C.117.14 Linear_Memory_Properties.pm_linear_resolve_write_ok

Terse proof for `pm_linear_resolve_write_ok`.
`pm_linear_resolve_write_ok`:

{1} ∀ (pm: Plain_Memory[Linear_memory], s: (pm‘states), a: (pm‘rw_addr)):
is_linear_plain_memory?(pm) ⊃ OK?(linear_resolve(a, Write)(s))

Repeatedly Skolemizing and flattening,
Using lemma pm_linear_blessed,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of linear_blessed?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (-9 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pm_linear_resolve_write_ok`.
Q.E.D.

C.117.15 Linear_Memory_Properties.pm_linear_resolve_reg_transformers_other

Terse proof for `pm_linear_resolve_reg_transformers_other`.
`pm_linear_resolve_reg_transformers_other`:

{1} ∀ (pm: Plain_Memory[Linear_memory]):
is_linear_plain_memory?(pm) ⊃
(linear_resolve_register_transformers ⊆ pm_phy‘other_actions)

Expanding the definition of is_linear_plain_memory?,

Repeatedly Skolemizing and flattening,

This completes the proof of `pm_linear_resolve_reg_transformers_other`.

Q.E.D.

C.117.16 Linear_Memory_Properties.pm_unchanged_singleton_linear_resolve_reg_transfor

Terse proof for `pm_unchanged_singleton_linear_resolve_reg_transformers`.

`pm_unchanged_singleton_linear_resolve_reg_transformers:`

$$\{1\}\quad \forall\ (\mathrm{pm}:\ \mathrm{Plain\_Memory}[\mathrm{Linear\_memory}],\ q:\ [\mathrm{Physical\_memory} \to \mathrm{SuperResult}[\mathrm{Physical\_memory}]]):\ \mathrm{is\_linear\_plain\_memory?}(\mathrm{pm}) \wedge \mathrm{linear\_resolve\_register\_transformers}(q) \supset \mathrm{unchanged\_memory\_invariant?}(\mathrm{pm\_phy`mem},\ \mathrm{pm\_phy`states},\ \mathrm{singleton}(q),\ (\mathrm{pm\_phy`ro\_addr} \cup \mathrm{pm\_phy`rw\_addr}))$$

Repeatedly Skolemizing and flattening,

Using lemma pm_states,

Using lemma pm_plain_phy,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Expanding the definition of is_linear_plain_memory?,

Applying disjunctive simplification to flatten sequent,

Expanding the definition of plain_memory?,

Applying disjunctive simplification to flatten sequent,

Using lemma unchanged_memory_invariant_mono,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `raise_fault_unchanged_memory_invariant.2`.

Q.E.D.

C.117.23 Linear_Memory_Properties.apply_side_effects_pm_states

Terse proof for `apply_side_effects_pm_states`.

`apply_side_effects_pm_states`:

```
------------------------------------------------------------------------
{1}   ∀ (pm: Plain_Memory[Linear_memory], l: list[[Memory_Address_4G, list[Byte]]],
          f:
            [Memory_Address_4G, list[Byte] →
                 [Linear_memory → ExprResult[Linear_memory, list[Byte]]]]):
        is_linear_plain_memory?(pm) ∧
         every(λ (e: [Memory_Address_4G, list[Byte]]):
                   transformer_invariant?(pm`states, singleton(expr_2_super(f(e)))))
               (l)
         ⊃ transformer_invariant?(pm`states, singleton(expr_2_super(apply_side_effects(l, f))))
```

Expanding the definition of transformer_invariant?,

Inducting on l on formula 1,

we get 2 subgoals:

`apply_side_effects_pm_states.1:`

```
{1}  ∀ (pm: Plain_Memory[Linear_memory],
          f:
            [Memory_Address_4G, list[Byte] →
                [Linear_memory → ExprResult[Linear_memory, list[Byte]]]]):
       is_linear_plain_memory?(pm) ∧
        every(λ (e: [Memory_Address_4G, list[Byte]]):
                  ∀ (s: Linear_memory[Physical_memory, pm_phy],
                     q:
                       [Linear_memory[Physical_memory, pm_phy] →
                           SuperResult[Physical_memory]]):
                    pm‘states(s) ∧ singleton(expr_2_super(f(e)))(q) ⊃
                     result_pred(pm‘states)(q(s)))
              (null)
        ⊃
        (∀ (s: Linear_memory[Physical_memory, pm_phy],
            q: [Linear_memory[Physical_memory, pm_phy] → SuperRe-
     sult[Physical_memory]]):
           pm‘states(s) ∧ singleton(expr_2_super(apply_side_effects(null, f)))(q) ⊃
            result_pred(pm‘states)(q(s)))
```

Repeatedly Skolemizing and flattening,

Expanding the definition of apply_side_effects,

Expanding the definition of singleton,

Replacing using formula -4,

Expanding the definition of reduce,

Installing automatic rewrites from: result_pred expr_2_super expr_2_super_res ok_result

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `apply_side_effects_pm_states.1`.

`apply_side_effects_pm_states.2:`

```
{1}  ∀ (cons1_var: [Memory_Address_4G, list[Byte]],
        cons2_var: list[[Memory_Address_4G, list[Byte]]]):
       (∀ (pm: Plain_Memory[Linear_memory],
           f:
             [Memory_Address_4G, list[Byte] →

               ⊃ result_pred(pm‘states)(q(s))))
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Expanding the definition of every,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Instantiating the top quantifier in -3 with the terms: (s!1 expr_2_super(apply_side_effects(cons2_var!1, f!1))),
Expanding the definition of singleton,
Replacing using formula -6,
Hiding formulas: -6,
Keeping (-3 -4 -5 1) and hiding *,
Expanding the definition of apply_side_effects,
Expanding the definition of reduce,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `apply_side_effects_pm_states.2`.
Q.E.D.

C.117.24 Linear_Memory_Properties.apply_side_effects_ok

Terse proof for `apply_side_effects_ok`.
`apply_side_effects_ok:`

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], s: Linear_memory[Physical_memory, pm_phy],
          l: list[[Memory_Address_4G, list[Byte]]],
          f:
            [Memory_Address_4G, list[Byte] →
                [Linear_memory → ExprResult[Linear_memory, list[Byte]]]]):
        is_linear_plain_memory?(pm) ∧

Q.E.D.

C.117.42 Linear_Memory_Properties.xlat_pe_in_pdir_range

Terse proof for `xlat_pe_in_pdir_range`.

`xlat_pe_in_pdir_range:`

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], addr: Memory_Address_4G, s1, s2: Linear_memory):
       union(pm`ro_addr, pm`rw_addr)(addr) ∧
        is_linear_plain_memory?(pm) ∧ pm`states(s1) ∧ pm`states(s2)
        ⊃
        pe_in_pdir_range?(s1,
                          restrict[Address, Memory_Address_4G, boolean]
                              ((pm`ro_addr ∪ pm`rw_addr)))
                         (xlat_idx(pdir_lvl,
                                   data(read_data(pm_phy, pdbr_data_type)(PDBR)
                                                  (s2))`base_addr,
                                   addr))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of pe_in_pdir_range?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

`xlat_pe_in_pdir_range.1:`

```
{-1}  Mem?(addr'`type_of)
{-2}  0 ≤ addr'`offset
{-3}  addr'`offset < max_linear_offset
{-4}  union(pm'`ro_addr, pm'`rw_addr)(addr')
{-5}  is_linear_plain_memory?(pm')
{-6}  pm'`states(s1')
{-7}  pm'`states(s2')
--------------------------------------------------------------------------------
{1}  ∃ (lin_a:
            (restrict[Address, Memory_Address_4G, boolean]((pm'`ro_addr ∪ pm'`rw_addr)))):
       xlat_idx(pdir_lvl, data(read_data(pm_phy, pdbr_data_type)(PDBR)(s1'))`base_addr,
                lin_a)
        =
        xlat_idx(pdir_lvl, data(read_data(pm_phy, pdbr_data_type)(PDBR)(s2'))`base_addr,
                 addr')
```

Instantiating the top quantifier in 1 with the terms: (addr!1),
we get 2 subgoals:

`xlat_pe_in_pdir_range.1.1:`

```
{-1}  Mem?(addr'`type_of)
{-2}  0 ≤ addr'`offset
{-3}  addr'`offset < max_linear_offset
{-4}  union(pm'`ro_addr, pm'`rw_addr)(addr')
{-5}  is_linear_plain_memory?(pm')
{-6}  pm'`states(s1')
{-7}  pm'`states(s2')
--------------------------------------------------------------------------------
{1}  xlat_idx(pdir_lvl, data(read_data(pm_phy, pdbr_data_type)(PDBR)(s1'))`base_addr, addr')
      =
      xlat_idx(pdir_lvl, data(read_data(pm_phy, pdbr_data_type)(PDBR)(s2'))`base_addr, addr')
```

Expanding the definition of is_linear_plain_memory?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -9 with the terms: (s1!1 s2!1),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `xlat_pe_in_pdir_range.1.1`.
`xlat_pe_in_pdir_range.1.2:`

```
{-1}  Mem?(addr'`type_of)
{-2}  0 ≤ addr'`offset
{-3}  addr'`offset < max_linear_offset
{-4}  union(pm'`ro_addr, pm'`rw_addr)(addr')
{-5}  is_linear_plain_memory?(pm')
{-6}  pm'`states(s'_1)
{-7}  pm'`states(s'_2)
------------------------------------------------------------------------
{1}   restrict[Address, Memory_Address_4G, boolean]((pm'`ro_addr ∪ pm'`rw_addr))(addr')
```

Expanding the definition of restrict,
which is trivially true.
This completes the proof of `xlat_pe_in_pdir_range.1.2`.
`xlat_pe_in_pdir_range.2:`

```
{-1}  Mem?(addr'`type_of)
{-2}  0 ≤ addr'`offset
{-3}  addr'`offset < max_linear_offset
{-4}  union(pm'`ro_addr, pm'`rw_addr)(addr')
{-5}  is_linear_plain_memory?(pm')
{-6}  pm'`states(s'_1)
{-7}  pm'`states(s'_2)
------------------------------------------------------------------------
{1}   OK?(read_data(pm_phy, pdbr_data_type)(PDBR)(s'_1))
```

Expanding the definition of is_linear_plain_memory?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
This completes the proof of `xlat_pe_in_pdir_range.2`.
Q.E.D.

Replacing using formula -1,
Rewriting using difference_subset, matching in *,
This completes the proof of `linear_resolve_unchanged_pm_phy.2`.
Q.E.D.

C.117.50 Linear_Memory_Properties.linear_resolve_read_transformers_ok

Terse proof for `linear_resolve_read_transformers_ok`.
`linear_resolve_read_transformers_ok`:

{1}	∀ (pm: Plain_Memory[Linear_memory], addr: Memory_Address_4G): is_linear_plain_memory?(pm) ∧ union(pm‘ro_addr, pm‘rw_addr)(addr) ⊃ transformers_ok?(pm‘states, singleton(expr_2_super(linear_resolve(addr, Read))))

Installing automatic rewrites from: (singleton ok_expr_2_super)
Expanding the definition of transformers_ok?,
Repeatedly Skolemizing and flattening,
Expanding the definition of singleton,
Replacing using formula -7,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Using lemma pm_linear_resolve_read_ok,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_read_transformers_ok`.
Q.E.D.

C.117.51 Linear_Memory_Properties.linear_resolve_write_transformers_ok

Terse proof for `linear_resolve_write_transformers_ok`.

`linear_resolve_write_transformers_ok`:

{1} ∀ (pm: Plain_Memory[Linear_memory], addr: Memory_Address_4G):
is_linear_plain_memory?(pm) ∧ pm`rw_addr(addr) ⊃
transformers_ok?(pm`states, singleton(expr_2_super(linear_resolve(addr, Write))))

Installing automatic rewrites from: ok_expr_2_super
Expanding the definition of transformers_ok?,
Repeatedly Skolemizing and flattening,
Expanding the definition of singleton,
Replacing using formula -7,
Using lemma pm_linear_resolve_write_ok,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_write_transformers_ok`.
Q.E.D.

C.117.52 Linear_Memory_Properties.linear_resolve_transformer_invariant

Terse proof for `linear_resolve_transformer_invariant`.

`linear_resolve_transformer_invariant`:

{1} ∀ (pm: Plain_Memory[Linear_memory], addr: Memory_Address_4G, access: Memory_access):
is_linear_plain_memory?(pm) ∧ union(pm`ro_addr, pm`rw_addr)(addr) ⊃
transformer_invariant?(pm`states, singleton(expr_2_super(linear_resolve(addr, access))))

Expanding the definition of transformer_invariant?,
Repeatedly Skolemizing and flattening,
Using lemma linear_resolve_unchanged_pm_phy,
Using lemma unchanged_memory_invariant_invariant[Physical_memory],
Using lemma pm_states,
Expanding the definition of transformer_invariant?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (-9 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
Applying decompose-equality,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `linear_resolve_transformer_invariant`.
Q.E.D.

C.117.53 Linear_Memory_Properties.linear_resolve_states_TCC1

Terse proof for `linear_resolve_states_TCC1`.

`linear_resolve_states_TCC1`:

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], s: Linear_memory[Physical_memory, pm_phy],
          addr: Memory_Address_4G, access: Memory_access):
       union(pm`ro_addr, pm`rw_addr)(addr) ∧
        is_linear_plain_memory?(pm) ∧ pm`states(s) ∧ OK?(linear_resolve(addr, access)(s))
        ⊃
        OK?[Physical_memory, Address]
             (linear_resolve[Physical_memory, pm_phy](addr, access)(s))
         ∨
         Exception?[Physical_memory, Address]
              (linear_resolve[Physical_memory, pm_phy](addr, access)(s))
```

Repeatedly Skolemizing and flattening,
This completes the proof of `linear_resolve_states_TCC1`.
Q.E.D.

C.117.54 Linear_Memory_Properties.linear_resolve_states

Terse proof for `linear_resolve_states`.

`linear_resolve_states`:

```
{1}  ∀ (pm: Plain_Memory[Linear_memory], s: Linear_memory[Physical_memory, pm_phy],
          addr: Memory_Address_4G, access: Memory_access):
       union(pm`ro_addr, pm`rw_addr)(addr) ∧
        is_linear_plain_memory?(pm) ∧ pm`states(s) ∧ OK?(linear_resolve(addr, access)(s))
        ⊃ pm_phy`states(state(linear_resolve(addr, access)(s)))
```

Installing automatic rewrites from: has_next_state
Repeatedly Skolemizing and flattening,
Using lemma linear_resolve_unchanged_pm_phy,
Using lemma pm_states,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Replacing using formula -2,
Using lemma unchanged_memory_invariant_invariant,
Using lemma super_transformer_invariant_next_ok,
Installing automatic rewrites from: (expr_2_super! expr_2_super_res!)
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of singleton,
which is trivially true.
This completes the proof of `linear_resolve_states`.
Q.E.D.

C.117.55 Linear_Memory_Properties.linear_resolve_same_result

Terse proof for `linear_resolve_same_result`.

`linear_resolve_same_result:`

{1} ∀ (pm: Plain_Memory[Linear_memory], addr: Memory_Address_4G, ac1, ac2: Memory_access,

Q.E.D.

C.117.56 Linear_Memory_Properties.delta_memory_address

Terse proof for `delta_memory_address`.
`delta_memory_address:`

{1}	$\forall$ (addr: Memory_Address_4G, δ: nat): rem(expt(2, min_page))(offset(addr)) $+ \delta <$ expt(2, min_page) $\supset$ offset(addr $+ \delta$) $<$ max_linear_offset

Repeatedly Skolemizing and flattening,
Expanding the definition of $+$,
Using lemma aligned_add_below,
we get 2 subgoals:

`delta_memory_address.1`:

{-1} $\text{min\_page} \leq \text{bus\_width} \wedge$
$\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) < \text{expt}(2,\ \text{bus\_width})$
$\wedge$
$\text{aligned?}(\text{min\_page})(\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')))$
$\wedge\ \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2,\ \text{min\_page})$
$\supset$
$\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{delta}'$
$< \text{expt}(2,\ \text{bus\_width})$
{-2} $\text{Mem?}(\text{addr}'\text{`type\_of})$
{-3} $0 \leq \text{addr}'\text{`offset}$
{-4} $\text{addr}'\text{`offset} < \text{max\_linear\_offset}$
{-5} $\text{delta}' \geq 0$
{-6} $\text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2,\ \text{min\_page})$

{1} $\text{addr}'\text{`offset} + \text{delta}' < \text{max\_linear\_offset}$

Installing automatic rewrites from: (min_page! bus_width! max_linear_offset!)

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Using lemma rem_def2,

Expanding the definition of aligned?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `delta_memory_address.1`.

`delta_memory_address.2`:

{-1} $\text{Mem?}(\text{addr}'\text{`type\_of})$
{-2} $0 \leq \text{addr}'\text{`offset}$
{-3} $\text{addr}'\text{`offset} < \text{max\_linear\_offset}$
{-4} $\text{delta}' \geq 0$
{-5} $\text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2,\ \text{min\_page})$

{1} $\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) \geq 0$
{2} $\text{addr}'\text{`offset} + \text{delta}' < \text{max\_linear\_offset}$

Using lemma rem_floor,

Case splitting on expt(2, min_page) * floor(offset(addr!1) / expt(2, min_page)) >= 0,

we get 2 subgoals:

`delta_memory_address.2.1`:

{-1} $\text{expt}(2,\ \text{min\_page}) \times \text{floor}(\text{offset}(\text{addr}')/\text{expt}(2,\ \text{min\_page})) \geq 0$
{-2} $\text{offset}(\text{addr}') =$
$\text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{expt}(2,\ \text{min\_page}) \times \text{floor}(\text{offset}(\text{addr}')/\text{expt}(2,\ \text{min\_page}))$
{-3} $\text{Mem?}(\text{addr}'\text{`type\_of})$
{-4} $0 \leq \text{addr}'\text{`offset}$
{-5} $\text{addr}'\text{`offset} < \text{max\_linear\_offset}$
{-6} $\text{delta}' \geq 0$
{-7} $\text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) + \text{delta}' < \text{expt}(2,\ \text{min\_page})$

{1} $\text{offset}(\text{addr}') - \text{rem}(\text{expt}(2,\ \text{min\_page}))(\text{offset}(\text{addr}')) \geq 0$
{2} $\text{addr}'\text{`offset} + \text{delta}' < \text{max\_linear\_offset}$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `delta_memory_address.2.1`.

`delta_memory_address.2.2:`

Replacing using formula -8,

Replacing using formula -13,

Instantiating the top quantifier in -18 with the terms: (s!1),

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Hiding formulas: (-4 2),

Expanding the definition of extend,

Expanding the definition of virt_to_phys_range,

Using lemma linear_resolve_memory_address,

Expanding the definition of every,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Instantiating quantified variables,

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `linear_unchanged_invariant.1.1.1.1.1.1`.
