B.2 allocators.pvs

```
Allocator[State : Type] : Theory
% Specification of memory allocators working on plain memory,
% such as the stack allocator and the one for global variables.
Begin
  Importing Plain_Memory[State]

  % The allocator interface consists of two real methods and four
  % logical ones.
  % alloc allocates memory
```

```
  % free frees memory
  %
  % memory_pool The memory from which the allocator allocates. This should
  % be disjoint from all other live allocators.
  % allocated Gives the set of addresses that have been allocated by this
  % allocator. Used to get the disjointness of correctly
  % allocated variables.
  % private_mem Returns those memory regions that must not be changed
  % for this allocator to work properly.
  % freed_size Returns the size of the block that will be freed by
  % a free in the same state. Needed to require a correct
  % adjustment of the allocated predicate during free.

  % We exclude the possibility to allocate 0 Bytes here (this is
  % permitted by many malloc libraries). We further require that free
  % makes a visible change in the allocated predicate. Some malloc
  % libraries (or was it the C++ standard?) do not guarantee that freed
  % memory is really freed. We only require that the predicate is changed
  % (and not that freed memory can be allocated again), nevertheless, this
  % excludes empty free functions (such as in conservative garbage
  % collectors).
  %
  % One would expect a valid predicate, which is turned on by init and
  % maintained afterwards. This valid predicate would somehow classify
  % the set of states in which the allocator is expected to work.
  % However, the real methods alloc and free
  % have always the possibility to return fatal. The valid predicate would
  % only clutter the specification, therefore we keep it implicit.
  % The set of states in which the allocator is expected to work is
  % given by the states predicate of the involved plain memory.

  Allocator : Type = [#

% A shallow embedding of (some) C++ conversions as state transformers.

% Section numbers in comments throughout this file refer to
% "Programming languages - C++", ISO/IEC 14882:1998(E)

% Deviations from the C++ standard:
%
% This is preliminary work. Most of the standard hasn't even been considered
% yet.

% A note on PVS conversions: PVS has conversions as well. Should we declare
% the C++ conversion functions as PVS conversions, so that they are applied
% automatically, based on type information? We have decided against doing so
% for the following reasons. 1) Explicit conversions make the PVS translation
% of C++ code less readable, but the translated code is of little interest.
% What really matters is the proof state, which necessarily contains the
```

```
% conversions anyway. 2) Explicit conversions give us more control. It is not
% quite clear (to me, anyway) how the PVS type checker decides which
% conversions must be applied, and in which order. 3) Some C++ conversions
% require additional information (e.g. the lvalue-to-rvalue conversion must
% know the type of the stored value), and must therefore be made explicit
% anyway.

% Naming convention: conversions between different types are named
% <source>2<dest>
% where <source> and <dest> are the source and destination type, respectively, as
% given in types.pvs. Examples: bool2int, int2uint.

  % "An rvalue of type char [...] can be converted to an rvalue of type int if
  % int can represent all the values of the source type; otherwise, the source
  % rvalue can be converted to an rvalue of type unsigned int."

  % We take this to mean that in the former case, the value is not changed.

  % TODO: I have no idea how to model this correctly, for the *type* of the
  % conversion would depend on the condition. Also, I'm not sure what
  % should happen to source rvalues when int cannot represent all the
  % values of the source type, and unsigned int cannot represent the
  % particular rvalue. Below, only the first alternative (conversion to
  % int) is modeled. However, 4.7(3) specifies the behavior of conversions
  % to int when those conversions are *not* available as integral
  % promotions. To sum up, we can *always* convert to int; the behavior is
  % specified either by 4.5 or by 4.7. Likewise, we can always convert to
  % unsigned int; this is modeled in theory IntegralConversions below.

```

```
% Deviations from the C++ standard:
%=====================================
%
% Evaluation Order
%-------------------
% Note that the C++ standard leaves the evaluation order of subexpressions
% mostly unspecified. The behavior is undefined unless each expression
% satisfies a (somewhat obscure) side condition (cf. 5.4). We do not model
% this here; the following definitions instead use some fixed evaluation order.
% Michael Norrish in his paper
% "Deterministic expressions in C", 8th European Symposium on Programming
% (ETAPS), Amsterdam. 1999. LNCS 1576, pp147-161
% shows that the evaluation order is actually irrelevant for expressions that
% satisfy the side condition of 5.4. At the source code level, the evaluation
% order can be made deterministic by disallowing operands with side effects,
% storing their values in temporary variables instead: e.g.
% x = f() + g();
% could be replaced by
% t1 = f(); t2 = g(); x = t1 + t2;
%
% Modulo Arithmetic
%--------------------
% C++ defines some types and their corresponding operations to follow
% arithmetic modulo 2^n where n is the number of bits in the value
% representation. To be able detect integer overflows we do not model modulo
% arithmetic directly but instead we add the function mod which is defined to
% be the identity function for the value range of the respective datatype but
% which is otherwise undefined.
%
% Integer division "/" and remainder "%" (5.6.4) behave differently, see below.
%
% Bit-shift operators "<<" and ">>" (5.8.1) behave differently; see below.

%Open Issues:
%============
% - Calling Convention (5.2 functions)
% I don't think the C++ standard specifies just how exactly function
% arguments are stored on the stack (or even if there is a stack, for.that
% matter.) "call_f" obviously defines a certain (hopefully reasonable)
% behavior.
%
% This is defined in the ABI documents. (e.g., cdecl is defined in
% the calling convention is defined in 3.9 in the "System V ABI Intel 386
% Architecture Processor Supplement")
%
% - passing values to functions rather than addresses (5.2 functions)
% For specification/verification, it might be useful to have yet another PVS
% function for f which takes values (rather than expressions or addresses) as
% arguments. This hasn't been implemented yet.
%
% - entry points + address ranges for functions (5.2 functions)
% We should probably define for each function the range of addresses where
```

```
% the code of this function resides and the address of the entry point
%
% − should we implement exception values; some FPU ops and div 0 generate a
% well−defined hardware exception (e.g., Exception 0: divide error). Using
% Extended_Reals such an implementation could specify exception values (e.g.,
% x / 0 = div_0), check for these values and instead of exiting with Fatal
% return with the appropriate exception.

% To do:
%========
% − define expressions for bitfield types
% − with_new_refvar(ref, init)(Lambda (ref : (range(ref))) : xxx)
% − define << and >> operator
% − address of operator (&)
% − pointer assignment
% on assignment we have to adjust the pointer address to refer to the
% base class subobject of a derived object.

PointerToMemberExpressions[State : Type] : THEORY
BEGIN

  Importing UnaryExpressions

  pm : VAR Plain_Memory[State]

  a_ex : Var ET[State, Address]

  % 10 pt 5 "A base class subobject might have a layout different from the
  % layout of the most derived object of the same type."

  % 9.2 pt 17 "A pointer to a pod−struct object, suitably converted using a
  % reinterpret_cast, points to its initial member [...] and vice
  % versa."

  % GCC seems to adjust the addresses of a pointer upon pointer assignment. For
  % example, in the assignment B* bp = &a where class A : C, B {}; bp will be
  % set to point to the B subobject in A. This goes as far as that a vtable is
  % alloated for B. However, the vtable value is not identical to a
  % freestanding B.

%>> Können wir zeigen, das ein anderes Vorgehen Typinformation in Pointern oder
% in Pointer auf Klassenmember braucht?

%>> Ich würde daher pointer to member expressions wie folgt formalisieren:
  % We assume that members of a subobject are not reordered with members of
  % other subobjects or with members of the derived object. We can therefore
  % adjust the pointer to point to a base class. This base class may possibly
  % have a layout different from a standalone object.
```

```
  %
  % However, to detect this, type information must be stored with the object.

% We need to add one additional set of addresses to express that
% certain device state remains unchanged despite blessed accesses.
% Thereby the memory itself needs not to be blessed.
%
% Example: writing to RAM does not change the APIC EOI register state.
%
% Read, write, other_action and side effect transformers must establish
% an invariant which states:
% - that when reading a subset of the addresses is allowed, the same
% values are read, and
% - that device accesses behave the same before and after the blessed
% memory access
% - This rules out that the memory access counter is in the above set
% which is what we desire.
% - How can we formalize this point? How do we prevent the device from
```

```

% Author: Marcus Völp
%
% Rewriting rules for C++ statements. See statements.pvs for the statement
% formalization.
%

% The statement rewriting rules simplify code by symbolic
% simlification of the control flow constructs. For example a break will
% remove all following statements until it reaches a catch break in
% which case break ## catch_break is eleminated from the code.
% Statements are simplified right to left. Here one expression
% transformer respectively one lexpr transformer (StmtResult ->
% ExprResult) is allowed to occur after the simplification point. The
% forward rules simplify these two cases plus those cases with a leading
% statement automatically with the help of the respective rules for the
% standalone case. Because of the requirement on rewriting rules these
% lemmas have to be defined for any form a standalone simplifcation may
% assume. The forms are denoted by the s-c->s, ... sequence which stands
% for statement1 ## complex statement simplifies to statement1.

% $Id: statements.pvs,v 1.37.2.1.2.1.2.2 2008/05/14 14:25:00 tews Exp $
%
% Author: Tjark Weber (based on lecture material by Hendrik Tews)
% Marcus Völp (rewriting rules)
% (c) 2007 Radboud University
%
% A shallow embedding of (some) C++ statements as state transformers.

% Section numbers in comments throughout this file refer to
% "Programming languages − C++", ISO/IEC 14882:1998(E)

% Most statements have type
% State −> StmtResult[State]
%
% "case" and "default" label statements however have type
% StmtResult[State] −> StmtResult[State]
% so that they can catch a "Switch" or "Default" result.
%
% Functions of the former type are lifted to the latter type by modifying
% results of the form
% OK(state)
% only, and passing the result through unchanged otherwise (see the definitions
% of ## in state−transformer.pvs).

% Deviations from the C++ standard:
%
% "goto" (6.6.4) and goto labels (6.1) have not been modeled. This would not
% be difficult in principle, but the possibility of jumps into substatements
% (e.g. into an "if" or "while") would make the formalization of these
% statements more complicated. Also note that (backward) gotos may cause
% nontermination and would need to be modeled somewhat similar to loops.
%
% For the same reason, "case" and "default" labels are required to appear on
% top−level statements contained within the (compound) substatement of a
% "switch" statement only, contrary to what 6.4.2.6 specifies. (Note that this
% rules out code like Duff's Device.)
%
% The condition of a "switch" statement must evaluate to a value of type int
% (cf. 6.4.2.2).
```

```
% >> This is according to the standard: the condition must be of integral type,
% enum type (which has an integral base type) or of a class type that can
% be converted to an integral or enum type.
%
% Functions must always use a "return" statement to return; flowing off the
% end of a function is not allowed (cf. 6.6.3.2). This can be achieved through
% a trivial source code transformation, where a "return_void" statement is
% appended (as the body's last statement) to each function with return type
% void. Alternatively, "catch_return" (see expressions.pvs) could be
% overloaded to convert OK(s) into OK(s, unit), but that would probably cause
% ambiguities in type checking.

% Open Issues / To Do
%====================
% Open issue: can we reap benefit from this?
% 3.9.1 pt 7 representation of value of integral through pure binary system
% integral value = Sum (0 <= p <(?=) n) b[p] * 2^p with bits b[p]
%
% Can we conclude from this that the max_value_bits are the bits in the
% value representation, or more precisely that:
% [bits in object representation] >= [bits in value representation]
% size(uidt(unsigned)) * bits_per_byte >= max_value_bits(unsigned)

% Open issue:
% The underlying data model with its to_byte/from_byte encoding functions
% does not really allow to model individual bits which are in a type's
% object representation, but NOT in its value representation.

% Open issue: const, volatile
% Is it wise to formalise const, volatile as Cpp_Type; there seems to be
% no easy way to define that expressions on cv(t) behave like expressions
% on t. Should we use typ(c, v : bool) instead? Note that this implies
% dt(t) = dt(volatile(t)) and thus that hidden bits cannot indicate a
% volatile access.

% MV: To do:
% − classes are not CV qualified by their members however a cv class
% behave like all nonstatic members being cv qualified ; use the semantics
% compiler to generate appropriate member types
% − cv(array) = array(cv)
% − cv void only as function return parameter
% − cv function affects cv of this => use semantics compiler to type this

% => define dt(*) only for interpreted types with domain
% Number x Address x Semantics Pointer
```

```
% -> generic handling of dt
% -> generic behaviour of const, volatile
% -> Define CV_Arithmetric
% -> dt_const(t) = dt(t)
% -> dt_volatile(t) = dt(t) except for hidden bits

% Not modelled (yet):
% - Pointer-to-function
% - const/volatile specifiers
% - float, double, long double
% - Conversion between integral types and bitsets
% - Conversion between integral types and enumeration types

% - wird kein every mehr für Datentypen definiert?
% - dt_exists TCC durch instanziierung mit konkretem Modell beweisen
% 3.9.1.1: "In any particular implementation, a plain char object can
% take on either the same values as a signed char or an
% unsigned char; which one is implementation-defined." -- We
% take this to also mean that the value representation is the
% same for char and (either) signed char or unsigned char. (Why?)

% Todo:
% - should we encode arg_type as list[Cpp_Type]
% or better as members, below[members] -> CppType
% - variable arguments
% - semantic compiler generates var_args object to contain arguments
% - var_args object is passed to function
% - default values
% - semantics compiler initialises all uninitialised values with defaults.

% See abstract_data.pvs for the underlying data type model.
%
% Naming conventions:
% - theories are named "Cpp_<type>",
% - value ranges are named "range(<type>)",
% - data types are named "dt_<type>",
% where <type> is one of
% - uchar, schar, char,
% - short, int, long, longlong,
% - ushort, uint, ulong, ulonglong,
% - wchar_t,
% - bool,
% - void,
% - pointer,
% - reference.

% A Deep Embedding of non union; non class C++ Types
%
%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

% The primary uses of the following deep embedding of C++ datatypes are
% - thepolymorphic specificaiton of expressions on fundamental types,
% - the polymorphic specification of pointers and of references
%
% The below deep embedding does not formalise class and union members as these
% give rise to unlimited recursion. The following example illustrates this
% recursion:
%
```

```
% struct A {
% A* pt_A;
% };

  % Volatile Datatypes
  %=====================
  % 3.9.3 pt 1 "The cv-qualified or cv-unqualified versions of a type ...
  % shall have the same representation and alignment requirements"
  %
  % In the present specification the behaviour of all write accesses is that
  % of volatile accesses.
  %
  % The approach currently under discussion is to add a store-buffer like
  % unit --- the compiler layer for volatile accesses --- as an additional
  % memory layer. Non volatile writes may be buffered in this layer. Because
  % of 3.9.3 pt 1 non volatile reads of volatile written data should succeed
  % and return the same value. Therefore, we "have to (???)" use hidden bits
  % to signal a volatile access to the store buffer.
  %
  % Because hidden bits are not architectually justified, we provide two
  % models:
  %
  % - Model 1: which cannot distinguish volatile from non-volatile accesses
  % and which needs no hidden bits, and,
  % - Model 2: in which volatile accesses can be distinguished from
  % non-volatile accesses using hidden bits

C Proof scripts

Contents for Appendix C

C.1 Proofs for Abstract_Read_Write (abstract_data.pvs)

C.1.1 Abstract_Read_Write.read_data_valid_in_mem

Terse proof for `read_data_valid_in_mem`.
`read_data_valid_in_mem`:

{1} ∀ (addr: Address, dt: (interpreted_data_type?[Data]), pm: Memory_struct[State], s: State): OK?(read_data(pm, dt)(addr)(s)) ⊃ valid_in_mem(pm, dt)(addr)(s)

Repeatedly Skolemizing and flattening,
Expanding the definition of valid_in_mem,
Expanding the definition of read_data,
Expanding the definition of ok_lift,
Expanding the definition of ##,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using valid_iff_from_byte, matching in * where idt gets dt!1,
This completes the proof of `read_data_valid_in_mem`.
Q.E.D.

C.2 Proofs for Abstract_Read_Write_Plain (plain_memory.pvs)

This theory contains no provable formal statements.

C.3 Proofs for Address_Datatype (paging-data.pvs)

C.3.1 Address_Datatype.address_data_type_TCC1

Terse proof for `address_data_type_TCC1`.
`address_data_type_TCC1`:

{1} ∃ (x_1: (pod_data_type?[Memory_Address_4G])): TRUE

Using lemma address_data_type_exists,
This completes the proof of `address_data_type_TCC1`.
Q.E.D.

C.4 Proofs for Address_Helpers (constants.pvs)

C.4.1 Address_Helpers.type_add_rewrite

Terse proof for `type_add_rewrite`.
`type_add_rewrite`:

{1} ∀ (m_addr: Memory_Address, size: int): (m_addr + size)`type_of = m_addr`type_of

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `type_add_rewrite`.
Q.E.D.

C.4.2 Address_Helpers.offset_add_rewrite

Terse proof for `offset_add_rewrite`.
`offset_add_rewrite:`

{1} ∀ (m_addr: Memory_Address, size: int):
(m_addr + size)‘offset = m_addr‘offset + size

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `offset_add_rewrite`.
Q.E.D.

C.4.3 Address_Helpers.type_add_memory

Terse proof for `type_add_memory`.
`type_add_memory:`

{1} ∀ (m_addr, size): Mem?((m_addr + size)‘type_of)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `type_add_memory`.
Q.E.D.

C.4.4 Address_Helpers.address_add_zero

Terse proof for `address_add_zero`.
`address_add_zero:`

{1} ∀ (a: Address): a + 0 = a

Expanding the definition of +,
which is trivially true.
This completes the proof of `address_add_zero`.
Q.E.D.

C.4.5 Address_Helpers.address_add_sum

Terse proof for `address_add_sum`.
`address_add_sum:`

{1} ∀ (a: Address, i, j: int): (a + i) + j = a + (i + j)

Expanding the definition of +,
which is trivially true.
This completes the proof of `address_add_sum`.
Q.E.D.

C.4.6 Address_Helpers.reg_size_TCC1

Terse proof for `reg_size_TCC1`.

`reg_size_TCC1:`

{1} ∀ (max: Memory_Address, id: Register_Id):
¬ SYSENTER_EIP?(id) ∧
¬ SYSENTER_ESP?(id) ∧
¬ SYSENTER_CS?(id) ∧
¬ TR?(id) ∧
¬ LDTR?(id) ∧
¬ GDTR?(id) ∧ ¬ IDTR?(id) ∧ ¬ EFLAGS?(id) ∧ ¬ IP?(id) ∧ ¬ Mem?(id)
⊃ ¬ (GP?(id) ∧ Segment_Reg?(id)) ∧ ¬ (Segment_Reg?(id) ∧ Control_Reg?(id))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `reg_size_TCC1`.
Q.E.D.

C.4.7 Address_Helpers.reg_size_TCC2

Terse proof for `reg_size_TCC2`.

`reg_size_TCC2:`

{1} ∀ (max: Memory_Address, id: Register_Id):
¬ SYSENTER_EIP?(id) ∧
¬ SYSENTER_ESP?(id) ∧
¬ SYSENTER_CS?(id) ∧
¬ TR?(id) ∧
¬ LDTR?(id) ∧
¬ GDTR?(id) ∧ ¬ IDTR?(id) ∧ ¬ EFLAGS?(id) ∧ ¬ IP?(id) ∧ ¬ Mem?(id)
⊃ GP?(id) ∨ Segment_Reg?(id) ∨ Control_Reg?(id)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `reg_size_TCC2`.
Q.E.D.

C.5 Proofs for Address_Model (paging-data-models.pvs)

C.5.1 Address_Model.address_to_byte_TCC1

Terse proof for `address_to_byte_TCC1`.

`address_to_byte_TCC1:`

{1} ∀ (addr: Memory_Address_4G): offset(addr) ≥ 0

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: every less_than_max_byte overwrite_bool_bit_less overwrite_shift_bits_less max_linear_offset bus_width
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `address_to_byte_TCC1`.
Q.E.D.

C.5.2 Address_Model.address_to_byte_TCC2

Terse proof for `address_to_byte_TCC2`.
`address_to_byte_TCC2`:

```
{1}  ∀ (addr: Memory_Address_4G): cut_bits(offset(addr), 0, 8) < max_byte
```

Repeatedly Skolemizing and flattening,
Using lemma cut_bits_below,
Rewriting using less_than_max_byte, matching in *,
This completes the proof of `address_to_byte_TCC2`.
Q.E.D.

C.5.3 Address_Model.address_to_byte_TCC3

Terse proof for `address_to_byte_TCC3`.
`address_to_byte_TCC3`:

```
{1}  ∀ (addr: Memory_Address_4G):
       every[nat]
           ({s: nat | s < max_byte})
           ((:cut_bits(offset(addr), 8, 8), cut_bits(offset(addr), 16, 8),
                cut_bits(offset(addr), 24, 8):))
```

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: every less_than_max_byte overwrite_bool_bit_less overwrite_shift_bits_less max_linear_offset bus_width
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `address_to_byte_TCC3`.
Q.E.D.

C.5.4 Address_Model.address_from_byte_TCC1

Terse proof for `address_from_byte_TCC1`.
`address_from_byte_TCC1`:

```
{1}  ∀ (data: list[Byte], a: Address): address_valid?(data, a) ⊃ 0 < length[Byte](data)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `address_from_byte_TCC1`.
Q.E.D.

C.5.5 Address_Model.address_from_byte_TCC2

Terse proof for `address_from_byte_TCC2`.
`address_from_byte_TCC2`:

```
{1}  ∀ (data: list[Byte], a: Address): address_valid?(data, a) ⊃ 1 < length[Byte](data)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `address_from_byte_TCC2`.
Q.E.D.

C.5.6 Address_Model.address_from_byte_TCC3

Terse proof for `address_from_byte_TCC3`.

`address_from_byte_TCC3:`

```
|-------
{1}   ∀ (data: list[Byte], a: Address): address_valid?(data, a) ⊃ 2 < length[Byte](data)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `address_from_byte_TCC3`.

Q.E.D.

C.5.7 Address_Model.address_from_byte_TCC4

Terse proof for `address_from_byte_TCC4`.

`address_from_byte_TCC4:`

```
|-------
{1}   ∀ (data: list[Byte], a: Address): address_valid?(data, a) ⊃ 3 < length[Byte](data)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `address_from_byte_TCC4`.

Q.E.D.

C.5.8 Address_Model.address_from_byte_TCC5

Terse proof for `address_from_byte_TCC5`.

`address_from_byte_TCC5:`

{1} ∀ (data: list[Byte], a: Address):
address_valid?(data, a) ⊃
Mem?(Mem(overwrite_shift_bits(overwrite_shift_bits(overwrite_shift_bits(overwrite_shift_bits
(0,
nt
(d
0
8)
nth
(dat
8,
8),
nth[Byte](data, 2), 16, 8),
nth[Byte](data, 3), 24, 8))‘type_of)
∧
0 ≤
Mem(overwrite_shift_bits(overwrite_shift_bits(overwrite_shift_bits(overwrite_shift_bits
(0,
nth[By
(data,
0,
8),
nth[Byte
(data, 1
8,
8),
nth[Byte](data, 2), 16, 8),
nth[Byte](data, 3), 24, 8))‘offset
∧
Mem(overwrite_shift_bits(overwrite_shift_bits(overwrite_shift_bits(overwrite_shift_bits
(0,
nth[By
(data,
0,
8),
nth[Byte
(data, 1
8,
8),
nth[Byte](data, 2), 16, 8),
nth[Byte](data, 3), 24, 8))‘offset
< max_linear_offset

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: every aligned_address? aligned_overwrite_shift_bits_more aligned_overwrite_shift_bits_less aligned_zero max_linear_expt_val overwrite_shift_bits_less address_valid? max_linear_offset bus_width

Expanding the definition of Mem,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `address_from_byte_TCC5`.

Q.E.D.

C.5.9 Address_Model.address_model_TCC1

Terse proof for `address_model_TCC1`.

`address_model_TCC1:`

```
{1}  ∀ (f: [[Memory_Address_4G, Address] → [list[Byte] → bool]]):
       (f = (λ (d: Memory_Address_4G, a: Address): (zero_mask?(4)))) ⊃
        (∀ (x1: [Memory_Address_4G, Address]): singleton?[list[Byte]](f(x1)))
```

Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Using lemma singleton_zero_mask,
Expanding the definition of singleton?,
which is trivially true.
This completes the proof of `address_model_TCC1`.
Q.E.D.

C.5.10 Address_Model.address_valid_to_byte

Terse proof for `address_valid_to_byte`.

`address_valid_to_byte:`

```
{1}  ∀ (d: Memory_Address_4G, a: Address):
       valid?(uidt(address_model))(to_byte(address_model)(d, a), a)
```

Installing automatic rewrites from: address_model address_to_byte length address_valid?
Repeatedly simplifying with decision procedures, rewriting, propositional reasoning, quantifier instantiation, skolemization, if-lifting and equality replacement,
This completes the proof of `address_valid_to_byte`.
Q.E.D.

C.5.11 Address_Model.address_is_pod

Terse proof for `address_is_pod`.

`address_is_pod:`

```
{1}  pod_data_type?(address_model)
```

Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Expanding the definition of uninterpreted_data_type?,
Applying propositional simplification,
we get 6 subgoals:

`address_is_pod.1:`

```
{1}  ∀ (l: list[Byte], a: Address):
       ¬ length(l) = size(address_model`uidt) ⊃ ¬ valid?(address_model`uidt)(l, a)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of address_model,

Expanding the definition of address_valid?,
which is trivially true.
This completes the proof of `address_is_pod.1`.
`address_is_pod.2`:

```
{1}  ∀ (d: Memory_Address_4G, a: Address):
       valid?(uidt(address_model))(to_byte(address_model)(d, a), a)
```

Repeatedly Skolemizing and flattening,
Rewriting using address_valid_to_byte, matching in *,
This completes the proof of `address_is_pod.2`.
`address_is_pod.3`:

```
{1}  ∀ (l: list[Byte], a: Address):
       valid?(uidt(address_model))(l, a) ≡ up?(from_byte(address_model)(l, a))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of address_model,
Expanding the definition of address_from_byte,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `address_is_pod.3`.
`address_is_pod.4`:

```
{1}  ∀ (d: Memory_Address_4G, a: Address):
       down(from_byte(address_model)(to_byte(address_model)(d, a), a)) = d
```

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: address_model address_from_byte address_to_byte address_valid? length nth overwrite_shift_bits_zero cut_bits_cut_bits overwrite_shift_bits_merge max_linear_offset bus_width zero_aligned
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using shift_bits_left_cut_bits, matching in *,
Applying extensionality,
we get 2 subgoals:
`address_is_pod.4.1`:

```
{-1}  Mem?(d'‘type_of)
{-2}  0 ≤ d'‘offset
{-3}  d'‘offset < expt(2, 32)
------------------------------------------
{1}   Mem(offset(d'))‘offset = d'‘offset
```

Expanding the definition of Mem,
which is trivially true.
This completes the proof of `address_is_pod.4.1`.
`address_is_pod.4.2`:

```
{-1}  Mem?(d'‘type_of)
{-2}  0 ≤ d'‘offset
{-3}  d'‘offset < expt(2, 32)
------------------------------------------
{1}   Mem(offset(d'))‘type_of = d'‘type_of
```

Expanding the definition of Mem,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `address_is_pod.4.2`.

address_is_pod.5:

{1} ∀ (l: list[Byte], a1, a2: Address):
valid?(uidt(address_model))(l, a1) ≡ valid?(uidt(address_model))(l, a2)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Expanding the definition of address_model,
Expanding the definition of address_valid?,
which is trivially true.
This completes the proof of address_is_pod.5.
address_is_pod.6:

{1} size(uidt(address_model)) > 0

Expanding the definition of address_model,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of address_is_pod.6.
Q.E.D.

C.6 Proofs for Address_Util (memory.pvs)

C.6.1 Address_Util.address_block_subset_1

Terse proof for address_block_subset_1.
address_block_subset_1:

{1} ∀ (addr: Address, size: nat):
(address_block(addr + 1, size) ⊆ address_block(addr, 1 + size))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of address_block_subset_1.
Q.E.D.

C.6.2 Address_Util.address_block_subset_2

Terse proof for address_block_subset_2.
address_block_subset_2:

{1} ∀ (addresses: PRED[Address], addr: Address, size: nat):
(address_block(addr, size + 1) ⊆ addresses) ⊃
(address_block(addr + 1, size) ⊆ addresses)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of address_block_subset_2.
Q.E.D.

C.6.3 Address_Util.blocks_disjoint_disjoint

Terse proof for blocks_disjoint_disjoint.

`blocks_disjoint_disjoint:`

{1}	∀ (addr1, addr2: Address, size1, size2: nat): size1 > 0 ∧ size2 > 0 ⊃ blocks_disjoint?(addr1, size1, addr2, size2) = disjoint?(address_block(addr1, size1), address_block(addr2, size2))

Repeatedly Skolemizing and flattening,
Converting equality to IFF,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`blocks_disjoint_disjoint.1:`

{-1}	size1′ ≥ 0
{-2}	size2′ ≥ 0
{-3}	size1′ > 0
{-4}	size2′ > 0
{-5}	blocks_disjoint?(addr1′, size1′, addr2′, size2′)
{1}	disjoint?(address_block(addr1′, size1′), address_block(addr2′, size2′))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `blocks_disjoint_disjoint.1`.
`blocks_disjoint_disjoint.2:`

{-1}	size1′ ≥ 0
{-2}	size2′ ≥ 0
{-3}	size1′ > 0
{-4}	size2′ > 0
{-5}	disjoint?(address_block(addr1′, size1′), address_block(addr2′, size2′))
{1}	blocks_disjoint?(addr1′, size1′, addr2′, size2′)

Expanding the definition of blocks_disjoint?,
Applying disjunctive simplification to flatten sequent,
Expanding the definition(s) of (disjoint? empty? intersection member),
Case splitting on addr1!1 < addr2!1,
we get 2 subgoals:
`blocks_disjoint_disjoint.2.1:`

{-1}	addr1′ < addr2′
{-2}	size1′ ≥ 0
{-3}	size2′ ≥ 0
{-4}	size1′ > 0
{-5}	size2′ > 0
{-6}	type_of(addr1′) = type_of(addr2′)
{-7}	∀ (x: Address): ¬ (address_block(addr1′, size1′)(x) ∧ address_block(addr2′, size2′)(x))
{1}	addr1′ + size1′ ≤ addr2′
{2}	addr2′ + size2′ ≤ addr1′

Instantiating the top quantifier in -7 with the terms: addr2′,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `blocks_disjoint_disjoint.2.1`.

`blocks_disjoint_disjoint.2.2:`

{-1} $\text{size1}' \geq 0$
{-2} $\text{size2}' \geq 0$
{-3} $\text{size1}' > 0$
{-4} $\text{size2}' > 0$
{-5} $\text{type\_of}(\text{addr1}') = \text{type\_of}(\text{addr2}')$
{-6} $\forall\ (x\texttt{: Address}):$
$\neg\ (\text{address\_block}(\text{addr1}', \text{size1}')(x) \wedge \text{address\_block}(\text{addr2}', \text{size2}')(x))$

{1} $\text{addr1}' < \text{addr2}'$
{2} $\text{addr1}' + \text{size1}' \leq \text{addr2}'$
{3} $\text{addr2}' + \text{size2}' \leq \text{addr1}'$

Instantiating the top quantifier in -6 with the terms: addr1′,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `blocks_disjoint_disjoint.2.2`.
Q.E.D.

C.6.4 Address_Util.blocks_disjoint_symmetric

Terse proof for `blocks_disjoint_symmetric`.

`blocks_disjoint_symmetric:`

{1} $\forall$ (addr1, addr2: Address, size1, size2: nat):
blocks_disjoint?(addr1, size1, addr2, size2) = blocks_disjoint?(addr2, size2, addr1, size1)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `blocks_disjoint_symmetric`.
Q.E.D.

C.6.5 Address_Util.blocks_in_larger_set

Terse proof for `blocks_in_larger_set`.

`blocks_in_larger_set:`

{1} $\forall$ (addr1, addr2: Address, size1, size2: nat, addresses: PRED[Address]):
$(\text{address\_block}(\text{addr1}, \text{size1}) \subseteq \text{addresses}) \wedge$
$(\text{address\_block}(\text{addr2}, \text{size2}) \subseteq \text{addresses}) \wedge$
blocks_disjoint?(addr1, size1, addr2, size2)
$\supset\ (\text{address\_block}(\text{addr2}, \text{size2}) \subseteq (\text{addresses} \setminus \text{address\_block}(\text{addr1}, \text{size1})))$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `blocks_in_larger_set`.
Q.E.D.

C.6.6 Address_Util.blocks_pairwise_disjoint_add

Terse proof for `blocks_pairwise_disjoint_add`.

`blocks_pairwise_disjoint_add:`

```
{1}  ∀ (addr: Address, size: posnat, blocks: list[[Address, posnat]]):
       blocks_pairwise_disjoint(blocks) ∧
        (∀ (oaddr: Address, osize: posnat):
             member((oaddr, osize), blocks) ⊃ blocks_disjoint?(addr, size, oaddr, osize))
        ⊃ blocks_pairwise_disjoint(cons((addr, size), blocks))
```

Expanding the definition of blocks_pairwise_disjoint,
Repeatedly Skolemizing and flattening,
Expanding the definition of member,
Case splitting on addr!2 = addr!1 AND size!2 = size!1,
we get 2 subgoals:
`blocks_pairwise_disjoint_add.1:`

```
{-1}  addr'' = addr' ∧ size'' = size'
{-2}  size'' > 0
{-3}  size''' > 0
{-4}  size' > 0
{-5}  ∀ (addr_1, addr_2: Address, size_1, size_2: posnat):
        member((addr_1, size_1), blocks') ∧

{2}   blocks_disjoint?(addr'', size'', addr''', size''')
```

Instantiating the top quantifier in -6 with the terms: addr'', addr''', size'', size''',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `blocks_pairwise_disjoint_add.2.2.2.2`.
Q.E.D.

C.6.7 Address_Util.blocks_pairwise_disjoint_remove

Terse proof for `blocks_pairwise_disjoint_remove`.

`blocks_pairwise_disjoint_remove:`

```
-------------------------------------------------------------------------------
{1}   ∀ (addr: Address, size: posnat, blocks: list[[Address, posnat]]):
        blocks_pairwise_disjoint(blocks) ⊃
         blocks_pairwise_disjoint(list_remove((addr, size), blocks))
```

Expanding the definition of blocks_pairwise_disjoint,
Repeatedly Skolemizing and flattening,
Rewriting using list_remove_commutative, matching in *,
Rewriting using member_list_remove, matching in *,
Rewriting using member_list_remove, matching in *,
Instantiating the top quantifier in -4 with the terms: addr'', addr''', size'', size''',
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `blocks_pairwise_disjoint_remove`.
Q.E.D.

C.6.8 Address_Util.subset_block_is_free

Terse proof for `subset_block_is_free`.

`subset_block_is_free:`

```
-------------------------------------------------------------------------------
{1}   ∀ (b_1, b_2: PRED[Address], alloc_points: list[[Address, posnat]]):
        (b_1 ⊆ b_2) ∧ block_is_free(b_2, alloc_points) ⊃ block_is_free(b_1, alloc_points)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of block_is_free,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,

Using lemma disjoint_mono,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using subset_equal, matching in *,
This completes the proof of `subset_block_is_free`.
Q.E.D.

C.6.9 Address_Util.block_is_free_add

Terse proof for `block_is_free_add`.
`block_is_free_add`:

{1} ∀ (block: PRED⌊Address⌋, alloc_points: list⌊⌊Address, posnat⌋⌋, addr: Address, size: posnat): block_is_free(block, alloc_points) ∧ disjoint?(block, address_block(addr, size)) ⊃ block_is_free(block, cons((addr, size), alloc_points))

Repeatedly Skolemizing and flattening,
Expanding the definition of block_is_free,
Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: member
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Instantiating the top quantifier in -3 with the terms: addr″, size″,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `block_is_free_add`.
Q.E.D.

C.7 Proofs for Alignment (vfiasco-prelude.pvs)

C.7.1 Alignment.aligned_zero

Terse proof for `aligned_zero`.
`aligned_zero`:

{1} ∀ (n: nat): aligned?(n)(0)

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Rewriting using divides_zero, matching in *,
This completes the proof of `aligned_zero`.
Q.E.D.

C.7.2 Alignment.zero_aligned

Terse proof for `zero_aligned`.
`zero_aligned`:

{1} ∀ (n: nat): aligned?(0)(n)

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Expanding the definition of expt,

Rewriting using one_divides, matching in *,
This completes the proof of `zero_aligned`.
Q.E.D.

C.7.3 Alignment.aligned_bigger

Terse proof for `aligned_bigger`.
`aligned_bigger:`

$$\frac{}{\{1\}\quad \forall\ (m,\ n_1,\ n_2\colon \text{nat})\colon\ n_2 \le n_1 \wedge \text{aligned?}(n_1)(m) \supset \text{aligned?}(n_2)(m)}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Forward chaining on divides_expt_gt,
This completes the proof of `aligned_bigger`.
Q.E.D.

C.7.4 Alignment.aligned_plus

Terse proof for `aligned_plus`.
`aligned_plus:`

$$\frac{}{\{1\}\quad \forall\ (m,\ n\colon \text{nat},\ a\colon \text{aligned}(n),\ b\colon \text{aligned}(m))\colon\ \text{aligned?}(\min(n,\ m))(a+b)}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of min,
Expanding the definition of aligned?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`aligned_plus.1:`

$$\frac{\begin{array}{ll}\{-1\} & m' \ge 0\\ \{-2\} & n' \ge 0\\ \{-3\} & \text{divides}(\text{expt}(2,\ n'),\ a')\\ \{-4\} & \text{divides}(\text{expt}(2,\ m'),\ b')\\ \{-5\} & n' > m'\end{array}}{\{1\}\quad \text{divides}(\text{expt}(2,\ m'),\ a'+b')}$$

Rewriting using divides_sum, matching in *,
Hiding formulas: -4, 2,
Using lemma expt_divides,
Simplifying, rewriting, and recording with decision procedures,
Using lemma divides_transitive,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_plus.1`.

`aligned_plus.2`:

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	divides(expt(2, n'), a')
{-4}	divides(expt(2, m'), b')
{1}	$n' > m'$
{2}	divides(expt(2, n'), $a' + b'$)

Rewriting using divides_sum, matching in *,
Hiding formulas: -3, 3,
Using lemma expt_divides,
Simplifying, rewriting, and recording with decision procedures,
Using lemma divides_transitive,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_plus.2`.
Q.E.D.

C.7.5 Alignment.aligned_plus_n

Terse proof for `aligned_plus_n`.
`aligned_plus_n`:

{1}	$\forall$ (n: nat, a, b: aligned(n)): aligned?(n)($a + b$)

Repeatedly Skolemizing and flattening,
Using lemma aligned_plus,
Expanding the definition of min,
which is trivially true.
This completes the proof of `aligned_plus_n`.
Q.E.D.

C.7.6 Alignment.aligned_minus_TCC1

Terse proof for `aligned_minus_TCC1`.
`aligned_minus_TCC1`:

{1}	$\forall$ (m, n: nat, a: aligned(n), b: aligned(m)): $a \geq b \supset a - b \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `aligned_minus_TCC1`.
Q.E.D.

C.7.7 Alignment.aligned_minus

Terse proof for `aligned_minus`.
`aligned_minus`:

{1}	$\forall$ (m, n: nat, a: aligned(n), b: aligned(m)): $a \geq b \supset$ aligned?(min(n, m))($a - b$)

Repeatedly Skolemizing and flattening,

Expanding the definition of min,
Expanding the definition of aligned?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`aligned_minus.1:`

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	divides(expt(2, n'), a')
{-4}	divides(expt(2, m'), b')
{-5}	$a' \geq b'$
{-6}	$n' > m'$
{1}	divides(expt(2, m'), $a' - b'$)

Rewriting using divides_diff, matching in *,
Hiding formulas: -4, 2,
Using lemma expt_divides,
Simplifying, rewriting, and recording with decision procedures,
Using lemma divides_transitive,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_minus.1`.
`aligned_minus.2:`

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	divides(expt(2, n'), a')
{-4}	divides(expt(2, m'), b')
{-5}	$a' \geq b'$
{1}	$n' > m'$
{2}	divides(expt(2, n'), $a' - b'$)

Rewriting using divides_diff, matching in *,
Hiding formulas: -3, 3,
Using lemma expt_divides,
Simplifying, rewriting, and recording with decision procedures,
Using lemma divides_transitive,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_minus.2`.
Q.E.D.

C.7.8 Alignment.aligned_mult_expt_2

Terse proof for `aligned_mult_expt_2`.
`aligned_mult_expt_2:`

{1}	$\forall$ (m, n: nat, a: aligned(n)): aligned?($n + m$)($a \times$ expt(2, m))

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Rewriting using expt_plus_aux, matching in *,
Using lemma divides_prod_elim1,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_mult_expt_2`.
Q.E.D.

C.7.9 Alignment.aligned_rem

Terse proof for `aligned_rem`.

`aligned_rem:`

{1}	$\forall$ (m, n, i: nat): aligned?(n)(m) $\supset$ aligned?(n)(rem(expt(2, i))(m))

Repeatedly Skolemizing and flattening,

Expanding the definition of aligned?,

Applying rem_def2

Instantiating the top quantifier in -1 with the terms: expt(2, n'), rem(expt(2, i'))(m'), 0,

we get 2 subgoals:

`aligned_rem.1:`

{-1}	rem(expt(2, n'))(rem(expt(2, i'))(m')) = 0 $\equiv$ divides(expt(2, n'), rem(expt(2, i'))(m') − 0)
{-2}	$m' \geq 0$
{-3}	$n' \geq 0$
{-4}	$i' \geq 0$
{-5}	divides(expt(2, n'), m')
{1}	divides(expt(2, n'), rem(expt(2, i'))(m'))

Simplifying, rewriting, and recording with decision procedures,

Hiding formulas: 2,

Case splitting on i!1 <= n!1,

we get 2 subgoals:

`aligned_rem.1.1:`

{-1}	$i' \leq n'$
{-2}	$m' \geq 0$
{-3}	$n' \geq 0$
{-4}	$i' \geq 0$
{-5}	divides(expt(2, n'), m')
{1}	rem(expt(2, n'))(rem(expt(2, i'))(m')) = 0

Rewriting using rem_mod, matching in *,

we get 2 subgoals:

`aligned_rem.1.1.1:`

{-1}	$i' \leq n'$
{-2}	$m' \geq 0$
{-3}	$n' \geq 0$
{-4}	$i' \geq 0$
{-5}	divides(expt(2, n'), m')
{1}	rem(expt(2, i'))(m') = 0

Using lemma rem_def2,

Simplifying, rewriting, and recording with decision procedures,

Forward chaining on divides_expt_gt,

This completes the proof of `aligned_rem.1.1.1`.

`aligned_rem.1.1.2:`

{-1}	$i' \leq n'$
{-2}	$m' \geq 0$
{-3}	$n' \geq 0$
{-4}	$i' \geq 0$
{-5}	divides(expt(2, n'), m')
{1}	rem(expt(2, i'))(m') $<$ expt(2, n')
{2}	rem(expt(2, n'))(rem(expt(2, i'))(m')) $=$ 0

Using lemma both_sides_expt_gt1_le,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_rem.1.1.2`.
`aligned_rem.1.2:`

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	$i' \geq 0$
{-4}	divides(expt(2, n'), m')
{1}	$i' \leq n'$
{2}	rem(expt(2, n'))(rem(expt(2, i'))(m')) $=$ 0

Rewriting using rem_rem, matching in *,
we get 2 subgoals:
`aligned_rem.1.2.1:`

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	$i' \geq 0$
{-4}	divides(expt(2, n'), m')
{1}	$i' \leq n'$
{2}	rem(expt(2, n'))(m') $=$ 0

Rewriting using rem_def2, matching in *,
This completes the proof of `aligned_rem.1.2.1`.
`aligned_rem.1.2.2:`

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	$i' \geq 0$
{-4}	divides(expt(2, n'), m')
{1}	divides(expt(2, n'), expt(2, i'))
{2}	$i' \leq n'$
{3}	rem(expt(2, n'))(rem(expt(2, i'))(m')) $=$ 0

Rewriting using expt_divides, matching in *,
This completes the proof of `aligned_rem.1.2.2`.
`aligned_rem.2:`

{-1}	$m' \geq 0$
{-2}	$n' \geq 0$
{-3}	$i' \geq 0$
{-4}	divides(expt(2, n'), m')
{1}	$0 <$ expt(2, n')
{2}	divides(expt(2, n'), rem(expt(2, i'))(m'))

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `aligned_rem.2`.

Q.E.D.

C.7.10 Alignment.aligned_add_below

Terse proof for `aligned_add_below`.

`aligned_add_below:`

{1}	$\forall\ (n,\ m,\ i,\ k\colon \text{nat}):$ $i \le k \wedge n < \text{expt}(2,\ k) \wedge \text{aligned?}(i)(n) \wedge m < \text{expt}(2,\ i) \supset$ $n + m < \text{expt}(2,\ k)$

Repeatedly Skolemizing and flattening,

Expanding the definition of aligned?,

Expanding the definition of divides,

Repeatedly Skolemizing and flattening,

Replacing using formula -8,

Applying bit_split_less

Instantiating the top quantifier in -1 with the terms: x', m', $k' - i'$, i',

we get 3 subgoals:

`aligned_add_below.1:`

{-1}	$m' < \text{expt}(2,\ i') \supset$ $(x' \times \text{expt}(2,\ i') + m' < \text{expt}(2,\ i' + k' - i') \equiv$ $x' < \text{expt}(2,\ k' - i'))$
{-2}	$\text{integer\_pred}(x')$
{-3}	$\text{expt}(2,\ i') \times x' \ge 0$
{-4}	$m' \ge 0$
{-5}	$i' \ge 0$
{-6}	$k' \ge 0$
{-7}	$i' \le k'$
{-8}	$\text{expt}(2,\ i') \times x' < \text{expt}(2,\ k')$
{-9}	$n' = \text{expt}(2,\ i') \times x'$
{-10}	$m' < \text{expt}(2,\ i')$
{1}	$\text{expt}(2,\ i') \times x' + m' < \text{expt}(2,\ k')$

Simplifying, rewriting, and recording with decision procedures,

Applying both_sides_times_pos_lt2

Instantiating the top quantifier in -1 with the terms: $\text{expt}(2, i')$, x', $\text{expt}(2, k' - i')$,

Simplifying, rewriting, and recording with decision procedures,

Rewriting using expt_plus, matching in *,

This completes the proof of `aligned_add_below.1`.

`aligned_add_below.2:`

{-1}	integer_pred(x')
{-2}	expt(2, i') $\times$ x' $\geq$ 0
{-3}	m' $\geq$ 0
{-4}	i' $\geq$ 0
{-5}	k' $\geq$ 0
{-6}	i' $\leq$ k'
{-7}	expt(2, i') $\times$ x' $<$ expt(2, k')
{-8}	n' = expt(2, i') $\times$ x'
{-9}	m' $<$ expt(2, i')
{1}	$k' - i'$ $\geq$ 0
{2}	expt(2, i') $\times$ $x' + m'$ $<$ expt(2, k')

Applying both_sides_expt_gt1_le
Instantiating the top quantifier in -1 with the terms: 2, i', k',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_add_below.2`.
`aligned_add_below.3:`

{-1}	integer_pred(x')
{-2}	expt(2, i') $\times$ x' $\geq$ 0
{-3}	m' $\geq$ 0
{-4}	i' $\geq$ 0
{-5}	k' $\geq$ 0
{-6}	i' $\leq$ k'
{-7}	expt(2, i') $\times$ x' $<$ expt(2, k')
{-8}	n' = expt(2, i') $\times$ x'
{-9}	m' $<$ expt(2, i')
{1}	x' $\geq$ 0
{2}	expt(2, i') $\times$ $x' + m'$ $<$ expt(2, k')

Applying pos_times_le
Instantiating the top quantifier in -1 with the terms: expt(2, i'), x',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_add_below.3`.
Q.E.D.

C.8 Proofs for Allocation_Info (allocators.pvs)

C.8.1 Allocation_Info.consistent_allocator_state_change

Terse proof for `consistent_allocator_state_change`.
`consistent_allocator_state_change:`

{1}	$\forall$ (ai: Allocator_Info, pm: (plain_memory?), ac: (allocator?(pm)), s_1, s_2: State): consistent_allocator?(pm)(ac, ai)(s_1) $\wedge$ ac`allocated(pm)($s_1$) = ac`allocated(pm)(s_2) $\supset$ consistent_allocator?(pm)(ac, ai)(s_2)

Repeatedly Skolemizing and flattening,
Expanding the definition of consistent_allocator?,
Applying disjunctive simplification to flatten sequent,

Simplifying, rewriting, and recording with decision procedures,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `consistent_allocator_state_change`.
Q.E.D.

C.8.2 Allocation_Info.consistent_allocator_read_TCC1

Terse proof for `consistent_allocator_read_TCC1`.

`consistent_allocator_read_TCC1:`

```
{1}  ∀ (ai: Allocator_Info, pm: (plain_memory?), s: State, ac: (allocator?[State](pm)),
          addr: Address):
       pm`states(s) ∧
        consistent_allocator?(pm)(ac, ai)(s) ∧ union(pm`ro_addr, pm`rw_addr)(addr)
        ⊃
        OK?[State, Byte](memory_read(pm`mem)(addr)(s)) ∨
         Exception?[State, Byte](memory_read(pm`mem)(addr)(s))
```

Repeatedly Skolemizing and flattening,
Rewriting using plain_memory_memory_read_ok, matching in *,
This completes the proof of `consistent_allocator_read_TCC1`.
Q.E.D.

C.8.3 Allocation_Info.consistent_allocator_read

Terse proof for `consistent_allocator_read`.

`consistent_allocator_read:`

```
{1}  ∀ (ai: Allocator_Info, pm: (plain_memory?), s: State, ac: (allocator?(pm)),
          addr: Address):
       pm`states(s) ∧
        consistent_allocator?(pm)(ac, ai)(s) ∧ union(pm`ro_addr, pm`rw_addr)(addr)
        ⊃ consistent_allocator?(pm)(ac, ai)(state(memory_read(pm`mem)(addr)(s)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of consistent_allocator?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using allocator_allocated_memory_read, matching in *,
This completes the proof of `consistent_allocator_read`.
Q.E.D.

C.8.4 Allocation_Info.consistent_allocator_write_TCC1

Terse proof for `consistent_allocator_write_TCC1`.

consistent_allocator_write_TCC1:

{1} ∀ (ai: Allocator_Info, pm: (plain_memory?), s: State, ac: (allocator?[State](pm)),
addr: Address, byte: Byte):
pm‘states(s) ∧
consistent_allocator?(pm)(ac, ai)(s) ∧
pm‘rw_addr(addr) ∧ ¬ ac‘private_mem(pm)(addr)
⊃
OK?[State, Unit](memory_write(pm‘mem)(addr, byte)(s)) ∨
Exception?[State, Unit](memory_write(pm‘mem)(addr, byte)(s))

Repeatedly Skolemizing and flattening,
Rewriting using plain_memory_memory_write_ok, matching in *,
This completes the proof of consistent_allocator_write_TCC1.
Q.E.D.

C.8.5 Allocation_Info.consistent_allocator_write

Terse proof for consistent_allocator_write.

consistent_allocator_write:

{1} ∀ (ai: Allocator_Info, pm: (plain_memory?), s: State, ac: (allocator?(pm)), addr: Address,
byte: Byte):
pm‘states(s) ∧
consistent_allocator?(pm)(ac, ai)(s) ∧
pm‘rw_addr(addr) ∧ ¬ ac‘private_mem(pm)(addr)
⊃ consistent_allocator?(pm)(ac, ai)(state(memory_write(pm‘mem)(addr, byte)(s)))

Repeatedly Skolemizing and flattening,
Expanding the definition of consistent_allocator?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using allocator_allocated_memory_write, matching in *,
This completes the proof of consistent_allocator_write.
Q.E.D.

C.8.6 Allocation_Info.consistent_allocator_alloc_TCC1

Terse proof for consistent_allocator_alloc_TCC1.

consistent_allocator_alloc_TCC1:

{1} ∀ (ai: Allocator_Info, pm: (plain_memory?), s: State, ac: (allocator?[State](pm)),
size: posnat):
pm‘states(s) ∧
consistent_allocator?(pm)(ac, ai)(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃
OK?[State, Address](ac‘alloc(pm)(size)(s)) ∨
Exception?[State, Address](ac‘alloc(pm)(size)(s))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `consistent_allocator_alloc_TCC1`.
Q.E.D.

C.8.7 Allocation_Info.consistent_allocator_alloc

Terse proof for `consistent_allocator_alloc`.
`consistent_allocator_alloc:`

```
{1}  ∀ (ai: Allocator_Info, pm: (plain_memory?), s: State, ac: (allocator?(pm)),
          size: posnat):
       pm‘states(s) ∧
        consistent_allocator?(pm)(ac, ai)(s) ∧
         OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
        ⊃
        consistent_allocator?(pm)(ac, cons((data(ac‘alloc(pm)(size)(s)), size), ai))
                                      (state(ac‘alloc(pm)(size)(s)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of consistent_allocator?,
Applying propositional simplification,
we get 2 subgoals:
`consistent_allocator_alloc.1:`

```
{-1}  plain_memory?(pm′)
{-2}  allocator?(pm′)(ac′)
{-3}  size′ > 0
{-4}  pm′‘states(s′)
{-5}  allocator_info?(ai′)
{-6}  ∀ (addr: Address, size: posnat):
        member((addr, size), ai′) ⊃
         (address_block(addr, size) ⊆ ac′‘allocated(pm′)(s′))
{-7}  OK?(ac′‘alloc(pm′)(size′)(s′))
-------------------------------------------------------------------------------
{1}   allocator_info?(cons((data(ac′‘alloc(pm′)(size′)(s′)), size′), ai′))
{2}   data(ac′‘alloc(pm′)(size′)(s′)) = null_address
```

Expanding the definition of allocator_info?,
Rewriting using blocks_pairwise_disjoint_add, matching in *,
Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Rewriting using blocks_disjoint_disjoint, matching in *,
Instantiating the top quantifier in -8 with the terms: oaddr′, osize′,
Simplifying, rewriting, and recording with decision procedures,
Using lemma disjoint_mono,
Installing automatic rewrites from: subset_equal
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Using lemma allocator_alloc_disjoint,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using disjoint_symmetric, matching in *,
This completes the proof of `consistent_allocator_alloc.1`.

`consistent_allocator_alloc.2:`

{-1} plain_memory?(pm′)
{-2} allocator?(pm′)(ac′)
{-3} size′ > 0
{-4} pm′‘states(s′)
{-5} allocator_info?(ai′)
{-6} ∀ (addr: Address, size: posnat):
member((addr, size), ai′) ⊃
(address_block(addr, size) ⊆ ac′‘allocated(pm′)(s′))
{-7} OK?(ac′‘alloc(pm′)(size′)(s′))

{1} ∀ (addr: Address, size: posnat):
member((addr, size), cons((data(ac′‘alloc(pm′)(size′)(s′)), size′), ai′))
⊃
(address_block(addr, size) ⊆ ac′‘allocated(pm′)(state(ac′‘alloc(pm′)(size′)(s′))))
{2} data(ac′‘alloc(pm′)(size′)(s′)) = null_address

Hiding formulas: -5,

Repeatedly Skolemizing and flattening,

Expanding the definition of member,

Applying propositional simplification,

we get 2 subgoals:

`consistent_allocator_alloc.2.1:`

{-1} addr′ = data(ac′‘alloc(pm′)(size′)(s′))
{-2} size″ = size′
{-3} size″ > 0
{-4} plain_memory?(pm′)
{-5} allocator?(pm′)(ac′)
{-6} size′ > 0
{-7} pm′‘states(s′)
{-8} ∀ (addr: Address, size: posnat):
member((addr, size), ai′) ⊃
(address_block(addr, size) ⊆ ac′‘allocated(pm′)(s′))
{-9} OK?(ac′‘alloc(pm′)(size′)(s′))

{1} (address_block(addr′, size″) ⊆ ac′‘allocated(pm′)(state(ac′‘alloc(pm′)(size′)(s′))))
{2} data(ac′‘alloc(pm′)(size′)(s′)) = null_address

Rewriting using allocator_allocated_alloc, matching in *,

Replacing using formula -1,

Replacing using formula -2,

Rewriting using union_subset3, matching in *,

This completes the proof of `consistent_allocator_alloc.2.1`.

`consistent_allocator_alloc.2.2:`

{-1} member((addr′, size″), ai′)
{-2} size″ > 0
{-3} plain_memory?(pm′)
{-4} allocator?(pm′)(ac′)

{-5}  pm'`states(s')
{-6}  allocator_info?(ai')
{-7}  (address_block(addr'', size') ⊆ ac'`allocated(pm')(s'))
{-8}  OK?(ac'`free(pm')(addr')(s'))
------------------------------------------------------------------------
{1}   member((addr'', size'),
             list_remove((addr', down(ac'`freed_size(pm')(addr')(s'))),
                         cons((addr', down(ac'`freed_size(pm')(addr')(s'))), ai')))
{2}   disjoint?(address_block(addr'', size'),
                address_block(addr', down(ac'`freed_size(pm')(addr')(s'))))
{3}   addr'' = addr' ∧ size' = down(ac'`freed_size(pm')(addr')(s'))
```

Rewriting using member_list_remove, matching in *,
Expanding the definition of member,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `consistent_allocator_free.2.2.2.3`.
Q.E.D.

C.9 Proofs for Allocation_Table (allocators.pvs)

C.9.1 Allocation_Table.allocation_finite_tree

Terse proof for `allocation_finite_tree`.
`allocation_finite_tree`:

```
------------------------------------------------------------------------
{1}   ∀ (pm: (plain_memory?), at: Allocation_Table(pm)): finite_tree?(at`hierarchy)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `allocation_finite_tree`.
Q.E.D.

C.9.2 Allocation_Table.allocation_subnodes_allocated_and_free

Terse proof for `allocation_subnodes_allocated_and_free`.
`allocation_subnodes_allocated_and_free`:

```
------------------------------------------------------------------------
{1}   ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
           ac1, ac2: (at`hierarchy`nodes)):
        allocation_ok?(pm)(at, s) ∧ at`hierarchy`edges(ac1, ac2) ⊃
          (ac2`memory_pool(pm)(s) ⊆ ac1`allocated(pm)(s)) ∧
            block_is_free(ac2`memory_pool(pm)(s), at`info(ac1))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocation_ok?,

Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocation_subnodes_allocated_and_free`.
Q.E.D.

C.9.3 Allocation_Table.allocation_subnodes_disjoint

Terse proof for `allocation_subnodes_disjoint`.
`allocation_subnodes_disjoint`:

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
          ac1, ac2, ac3: (at‘hierarchy‘nodes)):
       allocation_ok?(pm)(at, s) ∧
        at‘hierarchy‘edges(ac1, ac2) ∧ at‘hierarchy‘edges(ac1, ac3)
        ⊃ ac2 = ac3 ∨ disjoint?(ac2‘memory_pool(pm)(s), ac3‘memory_pool(pm)(s))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocation_ok?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -9 with the terms: ac1′, ac2′, ac3′,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocation_subnodes_disjoint`.
Q.E.D.

C.9.4 Allocation_Table.allocation_roots_disjoint

Terse proof for `allocation_roots_disjoint`.
`allocation_roots_disjoint`:

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
          ac1, ac2: (roots(at‘hierarchy))):
       allocation_ok?(pm)(at, s) ⊃
        ac1 = ac2 ∨ disjoint?(ac1‘memory_pool(pm)(s), ac2‘memory_pool(pm)(s))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocation_ok?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocation_roots_disjoint`.
Q.E.D.

C.9.5 Allocation_Table.allocation_private_memory_disjoint

Terse proof for `allocation_private_memory_disjoint`.
`allocation_private_memory_disjoint`:

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
          ac1, ac2: (at‘hierarchy‘nodes)):
       allocation_ok?(pm)(at, s) ⊃
        ac1 = ac2 ∨ disjoint?(ac1‘private_mem(pm), ac2‘private_mem(pm))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocation_ok?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocation_private_memory_disjoint`.
Q.E.D.

C.9.6 Allocation_Table.allocation_consistent_allocator

Terse proof for `allocation_consistent_allocator`.
`allocation_consistent_allocator:`

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm), ac: (at‘hierarchy‘nodes)):
       allocation_ok?(pm)(at, s) ⊃ consistent_allocator?(pm)(ac, at‘info(ac))(s)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocation_ok?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
This completes the proof of `allocation_consistent_allocator`.
Q.E.D.

C.9.7 Allocation_Table.allocation_allocated_allocation_point

Terse proof for `allocation_allocated_allocation_point`.
`allocation_allocated_allocation_point:`

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm), ac: (at‘hierarchy‘nodes),
          addr: Address, size: posnat):
       allocation_ok?(pm)(at, s) ∧ member((addr, size), at‘info(ac)) ⊃
        (address_block(addr, size) ⊆ ac‘allocated(pm)(s))
```

Repeatedly Skolemizing and flattening,
Using lemma allocation_consistent_allocator,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of consistent_allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocation_allocated_allocation_point`.
Q.E.D.

C.9.8 Allocation_Table.allocation_allocation_point_in_memory_pool

Terse proof for `allocation_allocation_point_in_memory_pool`.
`allocation_allocation_point_in_memory_pool:`

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm), ac: (at‘hierarchy‘nodes),
          addr: Address, size: posnat):
       pm‘states(s) ∧ allocation_ok?(pm)(at, s) ∧ member((addr, size), at‘info(ac)) ⊃
        (address_block(addr, size) ⊆ ac‘memory_pool(pm)(s))
```

Repeatedly Skolemizing and flattening,
Using lemma allocation_allocated_allocation_point,
Simplifying, rewriting, and recording with decision procedures,
Using lemma allocator_subset_allocated_memory_pool,
Simplifying, rewriting, and recording with decision procedures,
Forward chaining on subset_transitive,
This completes the proof of `allocation_allocation_point_in_memory_pool`.
Q.E.D.

C.9.9 Allocation_Table.allocators_different_in_hierachy

Terse proof for `allocators_different_in_hierachy`.

`allocators_different_in_hierachy`:

```
{1}  ∀ (pm: (plain_memory?), at: Allocation_Table(pm), ac1, ac2: (at‘hierarchy‘nodes)):
       at‘hierarchy‘edges(ac1, ac2) ⊃ ¬ ac1 = ac2
```

Repeatedly Skolemizing and flattening,
Using lemma different_nodes_on_edge[(allocator?(pm′))],
Simplifying, rewriting, and recording with decision procedures,
Adding type constraints for at!1‘hierarchy,
Expanding the definition of finite_tree?,
Expanding the definition of tree?,
which is trivially true.
This completes the proof of `allocators_different_in_hierachy`.
Q.E.D.

C.9.10 Allocation_Table.uppath_memory_pool

Terse proof for `uppath_memory_pool`.

`uppath_memory_pool`:

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm), p: (path?(at‘hierarchy))):
       allocation_ok?(pm)(at, s) ∧ pm‘states(s) ⊃
         (path_end(p)‘memory_pool(pm)(s) ⊆ path_start(p)‘memory_pool(pm)(s))
```

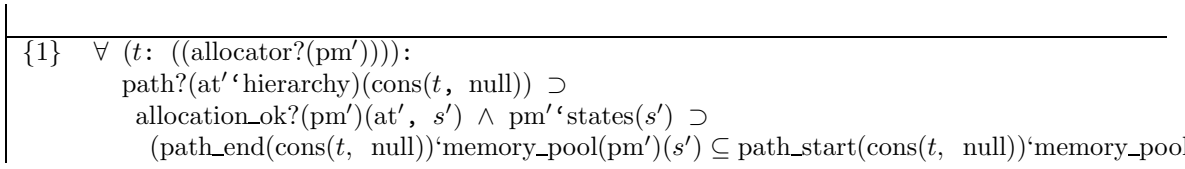
For the top quantifier in 1, we introduce Skolem constants: (pm′ s' at′ _),
Inducting on p on formula 1 using induction scheme path_list_induction[(allocator?(pm′))],
we get 3 subgoals:

`uppath_memory_pool.1`:

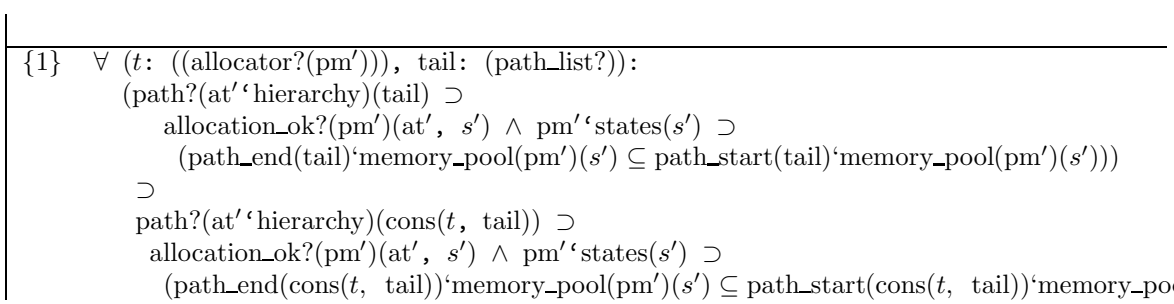
```
{-1}  allocation_ok?(pm′)(at′, s′)
{-2}  pm′‘states(s′)
------------------------------------------------------------------------
{1}   path?(at′‘hierarchy)(p′)
{2}   (path_end(p′)‘memory_pool(pm′)(s′) ⊆ path_start(p′)‘memory_pool(pm′)(s′))
```

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `uppath_memory_pool.1`.

`uppath_memory_pool.2`:



Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_start path_end length nth subset_reflexive
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `uppath_memory_pool.2`.
`uppath_memory_pool.3`:



Repeatedly Skolemizing and flattening,
Using lemma path_cdr,
Simplifying, rewriting, and recording with decision procedures,
Installing automatic rewrites from: path_start nth length path_list? path_end
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of path?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -7 with the terms: 0,
Simplifying, rewriting, and recording with decision procedures,
Using lemma allocation_subnodes_allocated_and_free,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Hiding formulas: -2,
Forward chaining on subset_transitive,
Hiding formulas: -2, -7,
Using lemma allocator_subset_allocated_memory_pool,
Simplifying, rewriting, and recording with decision procedures,
Forward chaining on subset_transitive,
This completes the proof of `uppath_memory_pool.3`.
Q.E.D.

C.9.11 Allocation_Table.uppath_memory_pool_allocated_and_free_TCC1

Terse proof for `uppath_memory_pool_allocated_and_free_TCC1`.

uppath_memory_pool_allocated_and_free_TCC1:

{1} ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
p: (path?[((allocator?(pm)))](at‘hierarchy))):
(path_end(p)‘memory_pool(pm)(s) ⊆ path_start(p)‘allocated(pm)(s)) ∧
pm‘states(s) ∧ allocation_ok?(pm)(at, s) ∧ length(p) ≥ 2
⊃ at‘hierarchy‘nodes(path_start[((allocator?(pm)))](p))

Repeatedly Skolemizing and flattening,
Rewriting using nodes_path_start, matching in *,
This completes the proof of uppath_memory_pool_allocated_and_free_TCC1.
Q.E.D.

C.9.12 Allocation_Table.uppath_memory_pool_allocated_and_free

Terse proof for uppath_memory_pool_allocated_and_free.

uppath_memory_pool_allocated_and_free:

{1} ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm), p: (path?(at‘hierarchy))):
pm‘states(s) ∧ allocation_ok?(pm)(at, s) ∧ length(p) ≥ 2 ⊃
(path_end(p)‘memory_pool(pm)(s) ⊆ path_start(p)‘allocated(pm)(s)) ∧
block_is_free(path_end(p)‘memory_pool(pm)(s), at‘info(path_start(p)))

Repeatedly Skolemizing and flattening,
Using lemma path_cdr,
Installing automatic rewrites from: path_list? length_cdr path_end path_start nth subset_reflexive
Simplifying, rewriting, and recording with decision procedures,
Using lemma uppath_memory_pool,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of path?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -7 with the terms: 0,
Simplifying, rewriting, and recording with decision procedures,
Using lemma allocation_subnodes_allocated_and_free,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Forward chaining on subset_transitive,
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: -1, -2,
Expanding the definition of block_is_free,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Using lemma disjoint_mono,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of uppath_memory_pool_allocated_and_free.
Q.E.D.

C.9.13 Allocation_Table.allocation_memory_pools

Terse proof for allocation_memory_pools.

`allocation_memory_pools:`

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
          ac1, ac2: (at‘hierarchy‘nodes)):
        pm‘states(s) ∧ allocation_ok?(pm)(at, s) ⊃
         ac1 = ac2 ∨
          disjoint?(ac1‘memory_pool(pm)(s), ac2‘memory_pool(pm)(s)) ∨
           ((ac1‘memory_pool(pm)(s) ⊆ ac2‘allocated(pm)(s)) ∧
              block_is_free(ac1‘memory_pool(pm)(s), at‘info(ac2)))
            ∨
            ((ac2‘memory_pool(pm)(s) ⊆ ac1‘allocated(pm)(s)) ∧
               block_is_free(ac2‘memory_pool(pm)(s), at‘info(ac1)))
```

Repeatedly Skolemizing and flattening,

Using lemma symmetric_node_pair_distinction[(allocator?(pm′))],

Splitting conjunctions,

we get 7 subgoals:

`allocation_memory_pools.1:`

```
{-1}  ∀ (n1_1, n2_1: (at′‘hierarchy‘nodes)):
        n1_1 = n2_1 ∨
         disjoint?(n1_1‘memory_pool(pm′)(s′), n2_1‘memory_pool(pm′)(s′)) ∨
          ((n1_1‘memory_pool(pm′)(s′) ⊆ n2_1‘allocated(pm′)(s′)) ∧
             block_is_free(n1_1‘memory_pool(pm′)(s′), at′‘info(n2_1)))
           ∨
           ((n2_1‘memory_pool(pm′)(s′) ⊆ n1_1‘allocated(pm′)(s′)) ∧
              block_is_free(n2_1‘memory_pool(pm′)(s′), at′‘info(n1_1)))
{-2}  plain_memory?(pm′)
{-3}  allocator?(pm′)(ac1′)
{-4}  at′‘hierarchy‘nodes(ac1′)
{-5}  allocator?(pm′)(ac2′)
{-6}  at′‘hierarchy‘nodes(ac2′)
{-7}  pm′‘states(s′)
{-8}  allocation_ok?(pm′)(at′, s′)
------------------------------------------------------------
{1}   ac1′ = ac2′
{2}   disjoint?(ac1′‘memory_pool(pm′)(s′), ac2′‘memory_pool(pm′)(s′))
{3}   ((ac1′‘memory_pool(pm′)(s′) ⊆ ac2′‘allocated(pm′)(s′)) ∧
         block_is_free(ac1′‘memory_pool(pm′)(s′), at′‘info(ac2′)))
{4}   ((ac2′‘memory_pool(pm′)(s′) ⊆ ac1′‘allocated(pm′)(s′)) ∧
         block_is_free(ac2′‘memory_pool(pm′)(s′), at′‘info(ac1′)))
```

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `allocation_memory_pools.1`.

`allocation_memory_pools.2:`

{-1} plain_memory?(pm′)
{-2} allocator?(pm′)(ac1′)
{-3} at′‘hierarchy‘nodes(ac1′)
{-4} allocator?(pm′)(ac2′)
{-5} at′‘hierarchy‘nodes(ac2′)
{-6} pm′‘states(s′)
{-7} allocation_ok?(pm′)(at′, s′)

{1} TRUE
{2} ac1′ = ac2′
{3} disjoint?(ac1′‘memory_pool(pm′)(s′), ac2′‘memory_pool(pm′)(s′))
{4} ((ac1′‘memory_pool(pm′)(s′) ⊆ ac2′‘allocated(pm′)(s′)) ∧
block_is_free(ac1′‘memory_pool(pm′)(s′), at′‘info(ac2′)))
{5} ((ac2′‘memory_pool(pm′)(s′) ⊆ ac1′‘allocated(pm′)(s′)) ∧
block_is_free(ac2′‘memory_pool(pm′)(s′), at′‘info(ac1′)))

which is trivially true.

This completes the proof of `allocation_memory_pools.2`.

`allocation_memory_pools.3:`

{-1} plain_memory?(pm′)
{-2} allocator?(pm′)(ac1′)
{-3} at′‘hierarchy‘nodes(ac1′)
{-4} allocator?(pm′)(ac2′)
{-5} at′‘hierarchy‘nodes(ac2′)
{-6} pm′‘states(s′)
{-7} allocation_ok?(pm′)(at′, s′)

{1} symmetric?(λ (n1, n2: (at′‘hierarchy‘nodes)):
n1 = n2 ∨
disjoint?(n1‘memory_pool(pm′)(s′), n2‘memory_pool(pm′)(s′)) ∨

C.9.14 Allocation_Table.allocation_info_TCC1

Terse proof for `allocation_info_TCC1`.

`allocation_info_TCC1:`

```
------------------------------------------------------------------------
{1}   ∀ (pm: (plain_memory?[State]), at: Allocation_Table(pm)):
        is_finite[(at`hierarchy`nodes)]
             (restrict[((allocator?(pm))), (at`hierarchy`nodes), boolean]
                  (at`hierarchy`nodes))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for at!1‘hierarchy,
Expanding the definition of finite_tree?,
Applying disjunctive simplification to flatten sequent,
Expanding the definition of finite?,
Hiding formulas: -2, -3,
Expanding the definition of restrict,
Expanding the definition of is_finite,
which is trivially true.
This completes the proof of `allocation_info_TCC1`.
Q.E.D.

C.9.15 Allocation_Table.member_allocation_info

Terse proof for `member_allocation_info`.
`member_allocation_info:`

```
{1}  ∀ (pm: (plain_memory?), at: Allocation_Table(pm), addr: Address, size: posnat):
       member((addr, size), allocation_info(pm)(at)) ⊃
         (∃ (ac: (at‘hierarchy‘nodes)): member((addr, size), at‘info(ac)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocation_info,
Using lemma member_flatten[[Address, posnat]],
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: -4,
Repeatedly Skolemizing and flattening,
Using lemma member_map,
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: -2,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `member_allocation_info`.
Q.E.D.

C.9.16 Allocation_Table.allocation_consistent

Terse proof for `allocation_consistent`.
`allocation_consistent:`

```
{1}  ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm)):
       pm‘states(s) ∧ allocation_ok?(pm)(at, s) ⊃
         allocator_info?(allocation_info(pm)(at))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator_info?,
Expanding the definition of blocks_pairwise_disjoint,
Repeatedly Skolemizing and flattening,
Rewriting using member_list_remove, matching in *,
Splitting conjunctions,
we get 2 subgoals:

`allocation_consistent.1:`

{-1}	$\text{size}' > 0$
{-2}	$\text{size}'' > 0$
{-3}	$\text{plain\_memory?}(\text{pm}')$
{-4}	$\text{pm}'\text{`states}(s')$
{-5}	$\text{allocation\_ok?}(\text{pm}')(\text{at}', s')$
{-6}	$\text{member}((\text{addr}', \text{size}'), \text{allocation\_info}(\text{pm}')(\text{at}'))$
{1}	TRUE
{2}	$\text{blocks\_disjoint?}(\text{addr}', \text{size}', \text{addr}'', \text{size}'')$

which is trivially true.
This completes the proof of `allocation_consistent.1`.
`allocation_consistent.2:`

{-1}	$\neg\ (\text{addr}'' = \text{addr}' \wedge \text{size}'' = \text{size}') \wedge$ $\text{member}((\text{addr}'', \text{size}''), \text{allocation\_info}(\text{pm}')(\text{at}'))$
{-2}	$\text{size}' > 0$

Applying disjunctive simplification to flatten sequent,
Forward chaining on member_allocation_info,
Forward chaining on member_allocation_info,
Hiding formulas: -3, -9,
Repeatedly Skolemizing and flattening,
Using lemma allocation_memory_pools,
Simplifying, rewriting, and recording with decision procedures,
Splitting conjunctions,
we get 4 subgoals:
`allocation_consistent.2.1:`

{-1}	$\text{ac}' = \text{ac}''$
{-2}	$\text{allocator?}(\text{pm}')(\text{ac}'')$
{-3}	$\text{at}'\text{`hierarchy`nodes}(\text{ac}'')$
{-4}	$\text{allocator?}(\text{pm}')(\text{ac}')$
{-5}	$\text{at}'\text{`hierarchy`nodes}(\text{ac}')$
{-6}	$\text{member}((\text{addr}', \text{size}'), \text{at}'\text{`info}(\text{ac}'))$
{-7}	$\text{member}((\text{addr}'', \text{size}''), \text{at}'\text{`info}(\text{ac}''))$
{-8}	$\text{size}' > 0$
{-9}	$\text{size}'' > 0$
{-10}	$\text{plain\_memory?}(\text{pm}')$
{-11}	$\text{pm}'\text{`states}(s')$
{-12}	$\text{allocation\_ok?}(\text{pm}')(\text{at}', s')$
{1}	$\text{addr}'' = \text{addr}' \wedge \text{size}'' = \text{size}'$
{2}	$\text{blocks\_disjoint?}(\text{addr}', \text{size}', \text{addr}'', \text{size}'')$

Using lemma allocation_consistent_allocator,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of consistent_allocator?,
Applying disjunctive simplification to flatten sequent,

Hiding formulas: -2,
Expanding the definition of allocator_info?,
Expanding the definition of blocks_pairwise_disjoint,
Instantiating quantified variables,
Rewriting using member_list_remove, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `allocation_consistent.2.1`.
`allocation_consistent.2.2`:

```
{-1}  disjoint?(ac'`memory_pool(pm')(s'), ac''`memory_pool(pm')(s'))
{-2}  allocator?(pm')(ac'')
{-3}  at'`hierarchy`nodes(ac'')
{-4}  allocator?(pm')(ac')
{-5}  at'`hierarchy`nodes(ac')
{-6}  member((addr', size'), at'`info(ac'))
{-7}  member((addr'', size''), at'`info(ac''))
{-8}  size' > 0
{-9}  size'' > 0
{-10} plain_memory?(pm')
{-11} pm'`states(s')
{-12} allocation_ok?(pm')(at', s')
------------------------------------------------------------
 {1}  addr'' = addr' ∧ size'' = size'
 {2}  blocks_disjoint?(addr', size', addr'', size'')
```

Rewriting using blocks_disjoint_disjoint, matching in *,
Using lemma allocation_allocation_point_in_memory_pool,
Using lemma allocation_allocation_point_in_memory_pool,
Simplifying, rewriting, and recording with decision procedures,
Forward chaining on disjoint_mono,
This completes the proof of `allocation_consistent.2.2`.
`allocation_consistent.2.3`:

```
{-1}  ((ac'`memory_pool(pm')(s') ⊆ ac''`allocated(pm')(s')) ∧
          block_is_free(ac'`memory_pool(pm')(s'), at'`info(ac'')))
{-2}  allocator?(pm')(ac'')
{-3}  at'`hierarchy`nodes(ac'')
{-4}  allocator?(pm')(ac')
{-5}  at'`hierarchy`nodes(ac')
{-6}  member((addr', size'), at'`info(ac'))
{-7}  member((addr'', size''), at'`info(ac''))
{-8}  size' > 0
{-9}  size'' > 0
{-10} plain_memory?(pm')
{-11} pm'`states(s')
{-12} allocation_ok?(pm')(at', s')
------------------------------------------------------------
 {1}  addr'' = addr' ∧ size'' = size'
 {2}  blocks_disjoint?(addr', size', addr'', size'')
```

Applying disjunctive simplification to flatten sequent,
Rewriting using blocks_disjoint_disjoint, matching in *,
Using lemma allocation_allocation_point_in_memory_pool,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of block_is_free,
Instantiating the top quantifier in -3 with the terms: addr'', size'',

Simplifying, rewriting, and recording with decision procedures,

Hiding formulas: -2,

Using lemma disjoint_mono,

Installing automatic rewrites from: subset_reflexive

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `allocation_consistent.2.3`.

`allocation_consistent.2.4`:

{-1}	((ac″‘memory_pool(pm′)(s′) ⊆ ac′‘allocated(pm′)(s′)) ∧ block_is_free(ac″‘memory_pool(pm′)(s′), at′‘info(ac′)))
{-2}	allocator?(pm′)(ac″)
{-3}	at′‘hierarchy‘nodes(ac″)
{-4}	allocator?(pm′)(ac′)
{-5}	at′‘hierarchy‘nodes(ac′)
{-6}	member((addr′, size′), at′‘info(ac′))
{-7}	member((addr″, size″), at′‘info(ac″))
{-8}	size′ > 0
{-9}	size″ > 0
{-10}	plain_memory?(pm′)
{-11}	pm′‘states(s′)
{-12}	allocation_ok?(pm′)(at′, s′)
{1}	addr″ = addr′ ∧ size″ = size′
{2}	blocks_disjoint?(addr′, size′, addr″, size″)

Applying disjunctive simplification to flatten sequent,

Hiding formulas: -1,

Rewriting using blocks_disjoint_disjoint, matching in *,

Using lemma allocation_allocation_point_in_memory_pool,

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of block_is_free,

Instantiating the top quantifier in -2 with the terms: addr′, size′,

Simplifying, rewriting, and recording with decision procedures,

Using lemma disjoint_mono,

Installing automatic rewrites from: subset_reflexive

Simplifying, rewriting, and recording with decision procedures,

Rewriting using disjoint_symmetric, matching in *,

This completes the proof of `allocation_consistent.2.4`.

Q.E.D.

C.9.17 Allocation_Table.allocation_alloc_other_private_memory_TCC1

Terse proof for `allocation_alloc_other_private_memory_TCC1`.

allocation_alloc_other_private_memory_TCC1:

{1} ∀ (pm: (plain_memory?), s: State, at: Allocation_Table(pm),
ac1, ac2: (at‘hierarchy‘nodes), size: posnat):
pm‘states(s) ∧
allocation_ok?(pm)(at, s) ∧
OK?(ac1‘alloc(pm)(size)(s)) ∧

Terse proof for `allocator_alloc_disjoint`.

`allocator_alloc_disjoint:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃
disjoint?(ac‘allocated(pm)(s),
address_block(data(ac‘alloc(pm)(size)(s)), size))

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s',
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_alloc_disjoint`.
Q.E.D.

C.10.14 Allocator.allocator_allocated_alloc_TCC1

Terse proof for `allocator_allocated_alloc_TCC1`.

`allocator_allocated_alloc_TCC1:`

{1} ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃
OK?[State, Address](ac‘alloc(pm)(size)(s)) ∨
Exception?[State, Address](ac‘alloc(pm)(size)(s))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `allocator_allocated_alloc_TCC1`.
Q.E.D.

C.10.15 Allocator.allocator_allocated_alloc

Terse proof for `allocator_allocated_alloc`.

`allocator_allocated_alloc:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃
ac‘allocated(pm)(state(ac‘alloc(pm)(size)(s))) =
(ac‘allocated(pm)(s) ∪ address_block(data(ac‘alloc(pm)(size)(s)), size))

Repeatedly Skolemizing and flattening,

Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s',
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_allocated_alloc`.
Q.E.D.

C.10.16 Allocator.allocator_memory_pool_alloc

Terse proof for `allocator_memory_pool_alloc`.
`allocator_memory_pool_alloc:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃ ac‘memory_pool(pm)(state(ac‘alloc(pm)(size)(s))) = ac‘memory_pool(pm)(s)

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s',
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_memory_pool_alloc`.
Q.E.D.

C.10.17 Allocator.allocator_subset_address_block_alloc_allocated

Terse proof for `allocator_subset_address_block_alloc_allocated`.
`allocator_subset_address_block_alloc_allocated:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), size: posnat, addr: Address, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃
(address_block(data(ac‘alloc(pm)(size)(s)), size) ⊆ ac‘allocated(pm)(state(ac‘alloc(pm)(size)(s)

Repeatedly Skolemizing and flattening,
Using lemma allocator_allocated_alloc,
Simplifying, rewriting, and recording with decision procedures,
Applying union_subset3 where a gets address_block(data(ac!1‘alloc(pm!1)(size!1)(s!1)), size!1), b gets ac!1‘allocated(pm!1)(s!1),
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_subset_address_block_alloc_allocated`.
Q.E.D.

C.10.18 Allocator.allocator_free_freed_size

Terse proof for `allocator_free_freed_size`.

`allocator_free_freed_size:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, s: State):
pm‘states(s) ⊃
(OK?(ac‘free(pm)(addr)(s)) ≡ up?(ac‘freed_size(pm)(addr)(s)))

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
This completes the proof of `allocator_free_freed_size`.
Q.E.D.

C.10.19 Allocator.allocator_allocated_free_TCC1

Terse proof for `allocator_allocated_free_TCC1`.

`allocator_allocated_free_TCC1:`

{1} ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), addr: Address, s: State):
pm‘states(s) ∧ OK?(ac‘free(pm)(addr)(s)) ⊃
OK?[State, Unit](ac‘free(pm)(addr)(s)) ∨
Exception?[State, Unit](ac‘free(pm)(addr)(s))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `allocator_allocated_free_TCC1`.
Q.E.D.

C.10.20 Allocator.allocator_allocated_free_TCC2

Terse proof for `allocator_allocated_free_TCC2`.

`allocator_allocated_free_TCC2:`

{1} ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), addr: Address, s: State):
pm‘states(s) ∧ OK?(ac‘free(pm)(addr)(s)) ⊃
up?[posnat](ac‘freed_size(pm)(addr)(s))

Repeatedly Skolemizing and flattening,
Rewriting using allocator_free_freed_size, matching in *,
This completes the proof of `allocator_allocated_free_TCC2`.
Q.E.D.

C.10.21 Allocator.allocator_allocated_free

Terse proof for `allocator_allocated_free`.

`allocator_allocated_free:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, s: State):
pm‘states(s) ∧ OK?(ac‘free(pm)(addr)(s)) ⊃
ac‘allocated(pm)(state(ac‘free(pm)(addr)(s))) =
(ac‘allocated(pm)(s) \ address_block(addr, down(ac‘freed_size(pm)(addr)(s))))

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s',
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_allocated_free`.
Q.E.D.

C.10.22 Allocator.allocator_memory_pool_free

Terse proof for `allocator_memory_pool_free`.
`allocator_memory_pool_free:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, s: State):
pm‘states(s) ∧ OK?(ac‘free(pm)(addr)(s)) ⊃
ac‘memory_pool(pm)(state(ac‘free(pm)(addr)(s))) = ac‘memory_pool(pm)(s)

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s',
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_memory_pool_free`.
Q.E.D.

C.10.23 Allocator.allocator_const_private_memory_memory_pool

Terse proof for `allocator_const_private_memory_memory_pool`.
`allocator_const_private_memory_memory_pool:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), s_1, s_2: State):

ac‘memory_pool(pm)(s_1) = ac‘memory_pool(pm)(s_2)

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s_1',
Simplifying, rewriting, and recording with decision procedures,

Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_const_private_memory_memory_pool`.
Q.E.D.

C.10.24 Allocator.allocator_const_private_memory_allocated

Terse proof for `allocator_const_private_memory_allocated`.
`allocator_const_private_memory_allocated`:

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), s_1, s_2: State):
pm‘states(s_1) ∧ pm‘states(s_2) ∧ stays_unchanged(pm)(s_1, s_2, ac‘private_mem(pm)) ⊃
ac‘allocated(pm)(s_1) = ac‘allocated(pm)(s_2)

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -3 with the terms: s_1',
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -7 with the terms: s_2',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_const_private_memory_allocated`.
Q.E.D.

C.10.25 Allocator.allocator_next_state_alloc_TCC1

Terse proof for `allocator_next_state_alloc_TCC1`.
`allocator_next_state_alloc_TCC1`:

{1} ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧ has_next_state(ac‘alloc(pm)(size)(s)) ⊃
OK?[State, Address](ac‘alloc(pm)(size)(s)) ∨
Exception?[State, Address](ac‘alloc(pm)(size)(s))

Repeatedly Skolemizing and flattening,
Expanding the definition of has_next_state,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `allocator_next_state_alloc_TCC1`.
Q.E.D.

C.10.26 Allocator.allocator_next_state_alloc

Terse proof for `allocator_next_state_alloc`.
`allocator_next_state_alloc`:

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧ has_next_state(ac‘alloc(pm)(size)(s)) ⊃
pm‘states(state(ac‘alloc(pm)(size)(s)))

Repeatedly Skolemizing and flattening,

Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_next_state_alloc`.
Q.E.D.

C.10.27 Allocator.allocator_next_state_free_TCC1

Terse proof for `allocator_next_state_free_TCC1`.

`allocator_next_state_free_TCC1`:

```
{1}  ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), addr: Address, s: State):
       pm‘states(s) ∧ has_next_state(ac‘free(pm)(addr)(s)) ⊃
         OK?[State, Unit](ac‘free(pm)(addr)(s)) ∨
           Exception?[State, Unit](ac‘free(pm)(addr)(s))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of has_next_state,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `allocator_next_state_free_TCC1`.
Q.E.D.

C.10.28 Allocator.allocator_next_state_free

Terse proof for `allocator_next_state_free`.

`allocator_next_state_free`:

```
{1}  ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, s: State):
       pm‘states(s) ∧ has_next_state(ac‘free(pm)(addr)(s)) ⊃
         pm‘states(state(ac‘free(pm)(addr)(s)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_next_state_free`.
Q.E.D.

C.10.29 Allocator.allocator_only_changes_alloc_TCC1

Terse proof for `allocator_only_changes_alloc_TCC1`.

allocator_only_changes_alloc_TCC1:

{1} ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃ pm‘states(state[State, Address](ac‘alloc(pm)(size)(s)))

Repeatedly Skolemizing and flattening,
Rewriting using allocator_next_state_alloc, matching in *,
Expanding the definition of has_next_state,
which is trivially true.
This completes the proof of allocator_only_changes_alloc_TCC1.
Q.E.D.

C.10.30 Allocator.allocator_only_changes_alloc

Terse proof for allocator_only_changes_alloc.
allocator_only_changes_alloc:

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), size: posnat, s: State):
pm‘states(s) ∧
OK?(ac‘alloc(pm)(size)(s)) ∧ ¬ data(ac‘alloc(pm)(size)(s)) = null_address
⊃ only_changes(pm)(s, state(ac‘alloc(pm)(size)(s)), ac‘private_mem(pm))

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of allocator_only_changes_alloc.
Q.E.D.

C.10.31 Allocator.allocator_only_changes_free_TCC1

Terse proof for allocator_only_changes_free_TCC1.
allocator_only_changes_free_TCC1:

{1} ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), free_addr: Address, s: State):
pm‘states(s) ∧ OK?(ac‘free(pm)(free_addr)(s)) ⊃
pm‘states(state[State, Unit](ac‘free(pm)(free_addr)(s)))

Repeatedly Skolemizing and flattening,
Rewriting using allocator_next_state_free, matching in *,
Expanding the definition of has_next_state,
which is trivially true.
This completes the proof of allocator_only_changes_free_TCC1.
Q.E.D.

C.10.32 Allocator.allocator_only_changes_free

Terse proof for `allocator_only_changes_free`.

`allocator_only_changes_free:`

```
{1}  ∀ (pm: (plain_memory?), ac: (allocator?(pm)), free_addr: Address, s: State):
       pm‘states(s) ∧ OK?(ac‘free(pm)(free_addr)(s)) ⊃
         only_changes(pm)(s, state(ac‘free(pm)(free_addr)(s)), ac‘private_mem(pm))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of allocator?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_only_changes_free`.
Q.E.D.

C.10.33 Allocator.allocator_allocated_memory_read_TCC1

Terse proof for `allocator_allocated_memory_read_TCC1`.

`allocator_allocated_memory_read_TCC1:`

```
{1}  ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), addr: Address, s: State):
       pm‘states(s) ∧ union(pm‘ro_addr, pm‘rw_addr)(addr) ⊃
         OK?[State, Byte](memory_read(pm‘mem)(addr)(s)) ∨
           Exception?[State, Byte](memory_read(pm‘mem)(addr)(s))
```

Repeatedly Skolemizing and flattening,
Rewriting using plain_memory_memory_read_ok, matching in *,
This completes the proof of `allocator_allocated_memory_read_TCC1`.
Q.E.D.

C.10.34 Allocator.allocator_allocated_memory_read

Terse proof for `allocator_allocated_memory_read`.

`allocator_allocated_memory_read:`

```
{1}  ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, s: State):
       pm‘states(s) ∧ union(pm‘ro_addr, pm‘rw_addr)(addr) ⊃
         ac‘allocated(pm)(state(memory_read(pm‘mem)(addr)(s))) = ac‘allocated(pm)(s)
```

Installing automatic rewrites from: plain_memory_states_memory_read
Repeatedly Skolemizing and flattening,
Rewriting using allocator_const_private_memory_allocated, matching in *,
we get 2 subgoals:

`allocator_allocated_memory_read.1:`

{-1} plain_memory?(pm′)
{-2} allocator?(pm′)(ac′)
{-3} pm′`states(s′)
{-4} union(pm′`ro_addr, pm′`rw_addr)(addr′)

{1} pm′`states(state(memory_read(pm′`mem)(addr′)(s′)))
{2} ac′`allocated(pm′)(state(memory_read(pm′`mem)(addr′)(s′))) =
ac′`allocated(pm′)(s′)

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_allocated_memory_read.1`.
`allocator_allocated_memory_read.2:`

{-1} plain_memory?(pm′)
{-2} allocator?(pm′)(ac′)
{-3} pm′`states(s′)
{-4} union(pm′`ro_addr, pm′`rw_addr)(addr′)

{1} stays_unchanged(pm′)
(state(memory_read(pm′`mem)(addr′)(s′)), s′, ac′`private_mem(pm′))
{2} ac′`allocated(pm′)(state(memory_read(pm′`mem)(addr′)(s′))) =
ac′`allocated(pm′)(s′)

Rewriting using stays_unchanged_symmetric, matching in *,
Using lemma plain_memory_stays_unchanged_memory_read,
Simplifying, rewriting, and recording with decision procedures,
Using lemma stays_unchanged_mono,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using allocator_subset_private_memory_plain_memory, matching in *,
This completes the proof of `allocator_allocated_memory_read.2`.
Q.E.D.

C.10.35 Allocator.allocator_memory_pool_memory_read

Terse proof for `allocator_memory_pool_memory_read`.
`allocator_memory_pool_memory_read:`

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, s: State):
pm`states(s) ∧ union(pm`ro_addr, pm`rw_addr)(addr) ⊃
ac`memory_pool(pm)(state(memory_read(pm`mem)(addr)(s))) =
ac`memory_pool(pm)(s)

Installing automatic rewrites from: plain_memory_states_memory_read
Repeatedly Skolemizing and flattening,
Rewriting using allocator_const_private_memory_memory_pool, matching in *,
we get 2 subgoals:
`allocator_memory_pool_memory_read.1:`

{-1} plain_memory?(pm′)
{-2} allocator?(pm′)(ac′)
{-3} pm′`states(s′)
{-4} union(pm′`ro_addr, pm′`rw_addr)(addr′)

{1} pm′`states(state(memory_read(pm′`mem)(addr′)(s′)))
{2} ac′`memory_pool(pm′)(state(memory_read(pm′`mem)(addr′)(s′))) =
ac′`memory_pool(pm′)(s′)

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `allocator_memory_pool_memory_read.1`.
`allocator_memory_pool_memory_read.2`:

```
{-1}  plain_memory?(pm')
{-2}  allocator?(pm')(ac')
{-3}  pm'`states(s')
{-4}  union(pm'`ro_addr, pm'`rw_addr)(addr')
------------------------------------------------------------------------
{1}   stays_unchanged(pm')
                    (state(memory_read(pm'`mem)(addr')(s')), s', ac'`private_mem(pm'))
{2}   ac'`memory_pool(pm')(state(memory_read(pm'`mem)(addr')(s'))) =
        ac'`memory_pool(pm')(s')
```

Rewriting using stays_unchanged_symmetric, matching in *,
Using lemma plain_memory_stays_unchanged_memory_read,
Simplifying, rewriting, and recording with decision procedures,
Using lemma stays_unchanged_mono,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using allocator_subset_private_memory_plain_memory, matching in *,
This completes the proof of `allocator_memory_pool_memory_read.2`.
Q.E.D.

C.10.36 Allocator.allocator_stays_unchanged_memory_write_private_mem_TCC1

Terse proof for `allocator_stays_unchanged_memory_write_private_mem_TCC1`.
`allocator_stays_unchanged_memory_write_private_mem_TCC1`:

```
{1}   ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), addr: Address, byte: Byte,
           s: State):
        pm`states(s) ∧ pm`rw_addr(addr) ∧ ¬ ac`private_mem(pm)(addr) ⊃
          OK?[State, Unit](memory_write(pm`mem)(addr, byte)(s)) ∨
            Exception?[State, Unit](memory_write(pm`mem)(addr, byte)(s))
```

Repeatedly Skolemizing and flattening,
Rewriting using plain_memory_memory_write_ok, matching in *,
This completes the proof of `allocator_stays_unchanged_memory_write_private_mem_TCC1`.
Q.E.D.

C.10.37 Allocator.allocator_stays_unchanged_memory_write_private_mem_TCC2

Terse proof for `allocator_stays_unchanged_memory_write_private_mem_TCC2`.
`allocator_stays_unchanged_memory_write_private_mem_TCC2`:

```
{1}   ∀ (pm: (plain_memory?[State]), ac: (allocator?(pm)), addr: Address, byte: Byte,
           s: State):
        pm`states(s) ∧ pm`rw_addr(addr) ∧ ¬ ac`private_mem(pm)(addr) ⊃
          pm`states(state[State, Unit](memory_write(pm`mem)(addr, byte)(s)))
```

Repeatedly Skolemizing and flattening,
Rewriting using plain_memory_states_memory_write, matching in *,

This completes the proof of `allocator_stays_unchanged_memory_write_private_mem_TCC2`.
Q.E.D.

C.10.38 Allocator.allocator_stays_unchanged_memory_write_private_mem

Terse proof for `allocator_stays_unchanged_memory_write_private_mem`.
`allocator_stays_unchanged_memory_write_private_mem`:

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, byte: Byte, s: State):
pm‘states(s) ∧ pm‘rw_addr(addr) ∧ ¬ ac‘private_mem(pm)(addr) ⊃
stays_unchanged(pm)
(s, state(memory_write(pm‘mem)(addr, byte)(s)), ac‘private_mem(pm))

Installing automatic rewrites from: plain_memory_states_memory_write
Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Using lemma plain_memory_stays_unchanged_memory_write,
Simplifying, rewriting, and recording with decision procedures,
Using lemma stays_unchanged_mono,
Simplifying, rewriting, and recording with decision procedures,
Hiding formulas: -1, 3,
Using lemma allocator_subset_private_memory_plain_memory,
Keeping (-1 1 2) and hiding *,
Rewriting relative to the theory: sets,
Simplifying, rewriting, and recording with decision procedures,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with decision procedures, rewriting, propositional reasoning, quantifier instantiation, skolemization, if-lifting and equality replacement,
This completes the proof of `allocator_stays_unchanged_memory_write_private_mem`.
Q.E.D.

C.10.39 Allocator.allocator_allocated_memory_write

Terse proof for `allocator_allocated_memory_write`.
`allocator_allocated_memory_write`:

{1} ∀ (pm: (plain_memory?), ac: (allocator?(pm)), addr: Address, byte: Byte, s: State):
pm‘states(s) ∧ pm‘rw_addr(addr) ∧ ¬ ac‘private_mem(pm)(addr) ⊃

(address_block(data(ac‘alloc(pm)(size)(s)), size) ⊆ ac‘memory_pool(pm)(s))

Repeatedly Skolemizing and flattening,
Using lemma allocator_subset_address_block_alloc_allocated,
Simplifying, rewriting, and recording with decision procedures,
Using lemma allocator_next_state_alloc,
Installing automatic rewrites from: has_next_state
Simplifying, rewriting, and recording with decision procedures,
Using lemma allocator_subset_allocated_memory_pool,
Simplifying, rewriting, and recording with decision procedures,
Rewriting using allocator_memory_pool_alloc, matching in *,
Forward chaining on subset_transitive,
This completes the proof of `allocator_subset_address_block_alloc_memory_pool`.
Q.E.D.

C.11 Proofs for ArithmeticExpressions (expressions.pvs)

C.11.1 ArithmeticExpressions.mod_impl_TCC1

Terse proof for `mod_impl_TCC1`.

mod_impl_TCC1:

{1} ∃ (x: ⌊d: ⌊int, {k: int | k ≠ 0}⌋ → {r: int | abs(r) < abs(d‘2)}⌋): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (a: int, b: {k: int | k ≠ 0}): 0),
we get 2 subgoals:
mod_impl_TCC1.1:

{1} TRUE

which is trivially true.
This completes the proof of mod_impl_TCC1.1.
mod_impl_TCC1.2:

{1} ∀ (b: {k: int | k ≠ 0}): abs(0) < abs(b)

Repeatedly Skolemizing and flattening,
Expanding the definition of abs,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of mod_impl_TCC1.2.
Q.E.D.

C.11.2 ArithmeticExpressions.div_impl_pos_range_TCC1

Terse proof for div_impl_pos_range_TCC1.
div_impl_pos_range_TCC1:

{1} ∀ (j: nat): j ≠ 0 ⊃ j > 0

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of div_impl_pos_range_TCC1.
Q.E.D.

C.11.3 ArithmeticExpressions.plus_ptr_TCC1

Terse proof for plus_ptr_TCC1.
plus_ptr_TCC1:

{1} ∀ (typ: Cpp_Subtype(cv(pointer?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?)),
ptr_val: (range_pointer(cv_base(typ))), n: (range(i_typ))):
not_null?(typ)(ptr_val) ⊃
array?(cv_base(typ)) ∨
pointer?(cv_base(typ)) ∨
reference?(cv_base(typ)) ∨
bitfield?(cv_base(typ)) ∨
enum?(cv_base(typ)) ∨
pointer_to_member?(cv_base(typ)) ∨
const?(cv_base(typ)) ∨ volatile?(cv_base(typ))

Repeatedly Skolemizing and flattening,
Keeping (-2 2) and hiding *,

Rewriting using cv_base_result, matching in *,

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `plus_ptr_TCC1`.

Q.E.D.

C.11.4 ArithmeticExpressions.plus_ptr_TCC2

Terse proof for `plus_ptr_TCC2`.

`plus_ptr_TCC2:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?)),
         ptr_val: (range_pointer(cv_base(typ))), n: (range(i_typ))):
       not_null?(typ)(ptr_val) ⊃ Cpp_Type?(typ(cv_base(typ)))
```

Repeatedly Skolemizing and flattening,

Keeping (-1 -2 1) and hiding *,

Expanding the definition of Cpp_Type?,

Repeatedly Skolemizing and flattening,

Instantiating the top quantifier in -1 with the terms: (t!1),

Splitting conjunctions,

we get 2 subgoals:

plus_ptr_TCC2.1:

{-1} $\text{no\_pointers\_to\_bitfield?}(t') \wedge \text{no\_pointers\_to\_references?}(t') \wedge \text{no\_cv\_references?}(t') \wedge \text{no\_reference\_to\_reference?}(t') \wedge \text{no\_reference\_to\_bitfields?}(t') \wedge \text{no\_pointer\_to\_member\_to\_reference?}(t') \wedge \text{no\_pointer\_to\_member\_to\_cv\_void?}(t') \wedge \text{no\_cv\_void\_parameter?}(t') \wedge \text{no\_array\_of\_references?}(t') \wedge \text{no\_array\_of\_cv\_void?}(t') \wedge \text{no\_array\_of\_function?}(t') \wedge \text{no\_array\_of\_abstract\_class?}(t') \wedge \text{no\_pointer\_or\_ref\_to\_incomplete\_array\_parameter?}(t') \wedge \text{no\_array\_return\_type?}(t') \wedge \text{no\_function\_return\_type?}(t') \wedge \text{bitfield\_underlying\_integral\_or\_enum\_type?}(t') \wedge \text{cv\_array?}(t') \wedge \text{enum\_underlying\_integral?}(t') \wedge \text{enum\_constants?}(t') \wedge \text{const\_volatile?}(t') \wedge \text{const\_stutter?}(t') \wedge \text{volatile\_stutter?}(t') \wedge \text{no\_cv\_class?}(t') \wedge \text{no\_cv\_union?}(t') \wedge \text{no\_cv\_function?}(t') \wedge \text{no\_reference\_to\_void?}(t') \wedge \text{no\_cv\_void?}(t') \wedge \text{no\_array\_of\_bitfields?}(t')$

{-2} $\text{cv(pointer?)}(\text{typ}')$

{-3} $\text{subterm}(t', \text{typ}(\text{cv\_base}(\text{typ}')))$

{1} $\text{no\_pointers\_to\_bitfield?}(t') \wedge \text{no\_pointers\_to\_references?}(t') \wedge \text{no\_cv\_references?}(t') \wedge \text{no\_reference\_to\_reference?}(t') \wedge \text{no\_reference\_to\_bitfields?}(t') \wedge \text{no\_pointer\_to\_member\_to\_reference?}(t') \wedge \text{no\_pointer\_to\_member\_to\_cv\_void?}(t') \wedge \text{no\_cv\_void\_parameter?}(t') \wedge \text{no\_array\_of\_references?}(t') \wedge \text{no\_array\_of\_cv\_void?}(t') \wedge \text{no\_array\_of\_function?}(t') \wedge \text{no\_array\_of\_abstract\_class?}(t') \wedge \text{no\_pointer\_or\_ref\_to\_incomplete\_array\_parameter?}(t') \wedge \text{no\_array\_return\_type?}(t') \wedge \text{no\_function\_return\_type?}(t') \wedge \text{bitfield\_underlying\_integral\_or\_enum\_type?}(t') \wedge \text{cv\_array?}(t') \wedge \text{enum\_underlying\_integral?}(t') \wedge \text{enum\_constants?}(t') \wedge \text{const\_volatile?}(t') \wedge \text{const\_stutter?}(t') \wedge \text{volatile\_stutter?}(t') \wedge \text{no\_cv\_class?}(t') \wedge \text{no\_cv\_union?}(t') \wedge \text{no\_cv\_function?}(t') \wedge \text{no\_reference\_to\_void?}(t') \wedge \text{no\_cv\_void?}(t') \wedge \text{no\_array\_of\_bitfields?}(t')$

which is trivially true.
This completes the proof of `plus_ptr_TCC2.1`.
`plus_ptr_TCC2.2:`

{-1} cv(pointer?)(typ′)
{-2} subterm(t′, typ(cv_base(typ′)))

{1} subterm(t′, typ′)
{2} no_pointers_to_bitfield?(t′) ∧
no_pointers_to_references?(t′) ∧
no_cv_references?(t′) ∧
no_reference_to_reference?(t′) ∧
no_reference_to_bitfields?(t′) ∧
no_pointer_to_member_to_reference?(t′) ∧
no_pointer_to_member_to_cv_void?(t′) ∧
no_cv_void_parameter?(t′) ∧
no_array_of_references?(t′) ∧

no_cv_class?(t′) ∧
no_cv_union?(t′) ∧
no_cv_function?(t′) ∧
no_reference_to_void?(t′) ∧
no_cv_void?(t′) ∧ no_array_of_bitfields?(t′)

Hiding formulas: 2,
Using lemma subterm_cv_base,
Using lemma cv_base_result,
we get 2 subgoals:
`plus_ptr_TCC2.2.1:`

{-1} pointer?(cv_base(typ′))
{-2} subterm(cv_base(typ′), typ′)
{-3} cv(pointer?)(typ′)
{-4} subterm(t′, typ(cv_base(typ′)))

{1} subterm(t′, typ′)

Using lemma subterm_transitive,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (-2 -4 1) and hiding *,
Expanding the definition of subterm,
which is trivially true.
This completes the proof of `plus_ptr_TCC2.2.1`.

`plus_ptr_TCC2.2.2:`

```
{-1}  subterm(cv_base(typ′), typ′)
{-2}  cv(pointer?)(typ′)
{-3}  subterm(t′, typ(cv_base(typ′)))
-------------------------------------
{1}   (pointer? ⊆ interpreted?)
{2}   subterm(t′, typ′)
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `plus_ptr_TCC2.2.2`.
Q.E.D.

C.11.5 ArithmeticExpressions.plus_ptr_TCC3

Terse proof for `plus_ptr_TCC3`.

`plus_ptr_TCC3:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?)),
         ptr_val: (range_pointer(cv_base(typ))), n: (range(i_typ))):
       not_null?(typ)(ptr_val) ⊃ pointer?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in * where P gets pointer?,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `plus_ptr_TCC3`.
Q.E.D.

C.11.6 ArithmeticExpressions.plus_ptr_TCC4

Terse proof for `plus_ptr_TCC4`.

`plus_ptr_TCC4:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?)),
         ptr_val: (range_pointer(cv_base(typ))), n: (range(i_typ))):
       ¬ (not_null?(typ)(ptr_val) ∧
            range_pointer(cv_base(typ))
                          (add(typ)(ptr_val, n × size_of(typ(cv_base(typ)))))
            ∧
            check_bounds(typ)
                          (add(typ)(ptr_val, n × size_of(typ(cv_base(typ))))))
        ⊃ pointer?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `plus_ptr_TCC4`.
Q.E.D.

C.11.7 ArithmeticExpressions.plus_ptr_TCC5

Terse proof for `plus_ptr_TCC5`.
`plus_ptr_TCC5:`

```
{1}   ∀ (typ: Cpp_Subtype(cv(pointer?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?)),
            ptr_val: (range_pointer(cv_base(typ)))):
        pointer?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `plus_ptr_TCC5`.
Q.E.D.

C.11.8 ArithmeticExpressions.plus_ptr_TCC6

Terse proof for `plus_ptr_TCC6`.
`plus_ptr_TCC6:`

```
{1}   ∀ (typ: Cpp_Subtype(cv(pointer?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
        pointer?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `plus_ptr_TCC6`.
Q.E.D.

C.11.9 ArithmeticExpressions.postinc_ptr_TCC1

Terse proof for `postinc_ptr_TCC1`.
`postinc_ptr_TCC1:`

```
{1}   ∀ ((typ: Cpp_Subtype(v(pointer?)))): cv(pointer?)(typ)
```

Repeatedly Skolemizing and flattening,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `postinc_ptr_TCC1`.
Q.E.D.

C.11.10 ArithmeticExpressions.postinc_ptr_TCC2

Terse proof for `postinc_ptr_TCC2`.
`postinc_ptr_TCC2:`

```
{1}   ∀ ((typ: Cpp_Subtype(v(pointer?)))): pointer?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Using lemma postinc_ptr_TCC1,

Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `postinc_ptr_TCC2`.
Q.E.D.

C.11.11 ArithmeticExpressions.postinc_ptr_TCC3

Terse proof for `postinc_ptr_TCC3`.
`postinc_ptr_TCC3:`

{1} ∀ ((typ: Cpp_Subtype(*v*(pointer?)))): range(uchar)(1)

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Expanding the definition of range,
Expanding the definition of range_integral,
Expanding the definition of extend,
Using lemma binary_range_uchar,
Using lemma max_uchar,
Using lemma pos_expt_gt,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `postinc_ptr_TCC3`.
Q.E.D.

C.11.12 ArithmeticExpressions.postinc_ptr_TCC4

Terse proof for `postinc_ptr_TCC4`.
`postinc_ptr_TCC4:`

{1} ∀ ((typ: Cpp_Subtype(*v*(pointer?)))):
Cpp_Type?(uchar) ∧ cv(non_bool_integral_enum?)(uchar)

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:
`postinc_ptr_TCC4.1:`

{1} Cpp_Type?(uchar)

Expanding the definition of Cpp_Type?,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `postinc_ptr_TCC4.1`.
`postinc_ptr_TCC4.2`:

```
{1}  cv(non_bool_integral_enum?)(uchar)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `postinc_ptr_TCC4.2`.
Q.E.D.

C.11.13 ArithmeticExpressions.subscript_TCC1

Terse proof for `subscript_TCC1`.
`subscript_TCC1`:

```
{1}  ∀ ((typ: Cpp_Subtype(array?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
       array?(typ) ∨
         pointer?(typ) ∨
           reference?(typ) ∨
             bitfield?(typ) ∨
               enum?(typ) ∨ pointer_to_member?(typ) ∨ const?(typ) ∨ volatile?(typ)
```

Repeatedly Skolemizing and flattening,
This completes the proof of `subscript_TCC1`.
Q.E.D.

C.11.14 ArithmeticExpressions.subscript_TCC2

Terse proof for `subscript_TCC2`.
`subscript_TCC2`:

```
{1}  ∀ ((typ: Cpp_Subtype(array?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
       Cpp_Type?(pointer(typ(typ))) ∧ cv(pointer?)(pointer(typ(typ)))
```

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
`subscript_TCC2.1`:

```
{-1}  Cpp_Type?(typ′)
{-2}  array?(typ′)
{-3}  Cpp_Type?(i_typ′)
{-4}  cv(non_bool_integral_enum?)(i_typ′)
{1}   Cpp_Type?(pointer(typ(typ′)))
```

Keeping (-1 -2 1) and hiding *,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Expanding the definition of subterm,
Splitting conjunctions,
we get 2 subgoals:

`subscript_TCC2.1.1:`

Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `subscript_TCC2.1.2`.
`subscript_TCC2.2`:

{-1}	Cpp_Type?(typ′)
{-2}	array?(typ′)
{-3}	Cpp_Type?(i_typ′)
{-4}	cv(non_bool_integral_enum?)(i_typ′)
{1}	cv(pointer?)(pointer(typ(typ′)))

Expanding the definition of cv,
Expanding the definition of c,
which is trivially true.
This completes the proof of `subscript_TCC2.2`.
Q.E.D.

C.11.15 ArithmeticExpressions.subscript_TCC3

Terse proof for `subscript_TCC3`.
`subscript_TCC3`:

{1}	∀ ((typ: Cpp_Subtype(array?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?))): Cpp_Type?(pointer(typ(typ)))

Repeatedly Skolemizing and flattening,
Using lemma subscript_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `subscript_TCC3`.
Q.E.D.

C.11.16 ArithmeticExpressions.subscript_TCC4

Terse proof for `subscript_TCC4`.
`subscript_TCC4`:

{1}	∀ ((typ: Cpp_Subtype(array?)), i_typ: Cpp_Subtype(cv(non_bool_integral_enum?))): pointer?(cv_base(pointer(typ(typ))))

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result2, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `subscript_TCC4`.
Q.E.D.

C.11.17 ArithmeticExpressions.ptr_to_nonzero_object_TCC1

Terse proof for `ptr_to_nonzero_object_TCC1`.

`ptr_to_nonzero_object_TCC1:`

```
{1}  ∀ (typ:
           Cpp_Subtype(extend[Cpp_Type_, (pointer?), bool, FALSE]
                             (λ (p: (pointer?)):
                                 ¬ void?(typ(p)) ∧ ¬ function?(typ(p)))):
       array?(cv_base(typ)) ∨
        pointer?(cv_base(typ)) ∨
         reference?(cv_base(typ)) ∨
          bitfield?(cv_base(typ)) ∨
           enum?(cv_base(typ)) ∨
            pointer_to_member?(cv_base(typ)) ∨
             const?(cv_base(typ)) ∨ volatile?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Keeping (-2 4) and hiding *,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:
`ptr_to_nonzero_object_TCC1.1:`

```
{-1}  pointer?(typ′)
{1}   cv(pointer?)(typ′)
{2}   pointer?(cv_base(typ′))
```

Hiding formulas: 2,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `ptr_to_nonzero_object_TCC1.1`.
`ptr_to_nonzero_object_TCC1.2:`

```
{-1}  pointer?(typ′)
{1}   (pointer? ⊆ interpreted?)
{2}   pointer?(cv_base(typ′))
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `ptr_to_nonzero_object_TCC1.2`.
Q.E.D.

C.11.18 ArithmeticExpressions.ptr_to_nonzero_object_TCC2

Terse proof for `ptr_to_nonzero_object_TCC2`.
`ptr_to_nonzero_object_TCC2:`

```
{1}  ∀ (typ:
           Cpp_Subtype(extend[Cpp_Type_, (pointer?), bool, FALSE]
                             (λ (p: (pointer?)):
                                 ¬ void?(typ(p)) ∧ ¬ function?(typ(p)))):
       array?(typ(cv_base(typ))) ⊃ Cpp_Type?(typ(cv_base(typ)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Expanding the definition of cv_base,
Keeping (-1 -2 3) and hiding *,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `ptr_to_nonzero_object_TCC2`.
Q.E.D.

C.11.19 ArithmeticExpressions.ptr_to_nonzero_object_TCC3

Terse proof for `ptr_to_nonzero_object_TCC3`.
`ptr_to_nonzero_object_TCC3:`

```
{1}   ∀ (typ:
              Cpp_Subtype(extend[Cpp_Type_, (pointer?), bool, FALSE]
                                (λ (p: (pointer?)):
                                     ¬ void?(typ(p)) ∧ ¬ function?(typ(p)))):
        (array?(typ(cv_base(typ))) ⊃ size_of(typ(cv_base(typ))) > 0) ⊃
         Cpp_Type?(typ(cv_base(typ)))
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -3,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,
Keeping (-1 -2 3) and hiding *,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `ptr_to_nonzero_object_TCC3`.
Q.E.D.

C.11.20 ArithmeticExpressions.ptr_to_nonzero_object

Terse proof for `ptr_to_nonzero_object`.
`ptr_to_nonzero_object:`

```
{1}   ∀ (typ:
              Cpp_Subtype(extend[Cpp_Type_, (pointer?), bool, FALSE]
                                (λ (p: (pointer?)):
                                     ¬ void?(typ(p)) ∧ ¬ function?(typ(p)))):
        (array?(typ(cv_base(typ))) ⊃ size_of(typ(cv_base(typ))) > 0) ⊃
         size_of(typ(cv_base(typ))) > 0
```

Repeatedly Skolemizing and flattening,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,

Expanding the definition of size_of,
Expanding the definition of uidt,
Expanding the definition of Cpp_Type?,
Instantiating the top quantifier in -1 with the terms: (typ!1),
Expanding the definition of subterm,
Applying disjunctive simplification to flatten sequent,
Hiding formulas: (-4 -5 -6 -7 -8 -9 -10 -11 -12 -13 -14 -15 -16),
Hiding formulas: (-13 -15),
Expanding the definition of no_pointers_to_bitfield?,
Expanding the definition of no_pointers_to_references?,
Installing automatic rewrites from: pod_size
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 13 subgoals:
`ptr_to_nonzero_object.1:`

{-1}	no_cv_references?(typ′)
{-2}	cv_array?(typ′)
{-3}	enum_underlying_integral?(typ′)

```

Repeatedly Skolemizing and flattening,

Keeping (-2 1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of minus_ptr_ptr_TCC2.

Q.E.D.

C.11.25 ArithmeticExpressions.minus_ptr_ptr_TCC3

Terse proof for minus_ptr_ptr_TCC3.

minus_ptr_ptr_TCC3:

```
{1}  ∀ (typ:
           Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                                (λ (p: (pointer?)):
                                     ¬ void?(typ(p)) ∧ ¬ function?(typ(p)))),
             ptr_val1: (range_pointer(cv_base(typ))),
             ptr_val2: (range_pointer(cv_base(typ))):
         (array?(typ(cv_base(typ))) ⊃ size_of(typ(cv_base(typ))) > 0) ∧
          not_null?(typ)(ptr_val1) ∧
           not_null?(typ)(ptr_val2) ∧
            same_array(typ)(ptr_val1, ptr_val2) ∧
             up?(address_of(typ)(ptr_val1)) ∧ up?(address_of(typ)(ptr_val2))
          ⊃ Cpp_Type?(typ(cv_base(typ)))
```

Repeatedly Skolemizing and flattening,

Using lemma minus_ptr_typ_is_Cpp_Type,

This completes the proof of minus_ptr_ptr_TCC3.

Q.E.D.

C.11.26 ArithmeticExpressions.minus_ptr_ptr_TCC4

Terse proof for minus_ptr_ptr_TCC4.

`minus_ptr_ptr_TCC4:`

{1} ∀ (typ:
Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
(λ (p: (pointer?)):
¬ void?(typ(p)) ∧ ¬ function?(typ(p)))),
ptr_val1: (range_pointer(cv_base(typ))),
ptr_val2: (range_pointer(cv_base(typ)))):
(array?(typ(cv_base(typ))) ⊃ size_of(typ(cv_base(typ))) > 0) ∧
not_null?(typ)(ptr_val1) ∧
not_null?(typ)(ptr_val2) ∧
same_array(typ)(ptr_val1, ptr_val2) ∧
up?(address_of(typ)(ptr_val1)) ∧ up?(address_of(typ)(ptr_val2))
⊃ size_of(typ(cv_base(typ))) > 0

Repeatedly Skolemizing and flattening,

Using lemma ptr_to_nonzero_object,

we get 2 subgoals:

`minus_ptr_ptr_TCC4.1:`

{-1} (array?(typ(cv_base(cv_base(typ′)))) ⊃
size_of(typ(cv_base(cv_base(typ′)))) > 0)
⊃ size_of(typ(cv_base(cv_base(typ′)))) > 0
{-2} Cpp_Type?(typ′)
{-3} cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
(λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))
(typ′)
{-4} range_pointer(cv_base(typ′))(ptr_val1′)
{-5} range_pointer(cv_base(typ′))(ptr_val2′)
{-6} (array?(typ(cv_base(typ′))) ⊃ size_of(typ(cv_base(typ′))) > 0)
{-7} not_null?(typ′)(ptr_val1′)
{-8} not_null?(typ′)(ptr_val2′)
{-9} same_array(typ′)(ptr_val1′, ptr_val2′)
{-10} up?(address_of(typ′)(ptr_val1′))
{-11} up?(address_of(typ′)(ptr_val2′))

{1} size_of(typ(cv_base(typ′))) > 0

Expanding the definition of cv_base,

Using lemma cv_base_not_const,

Using lemma cv_base_not_volatile,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `minus_ptr_ptr_TCC4.1`.

`minus_ptr_ptr_TCC4.2`:

```
{-1}   Cpp_Type?(typ′)
{-2}   cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
            (λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))
         (typ′)
{-3}   range_pointer(cv_base(typ′))(ptr_val1′)
{-4}   range_pointer(cv_base(typ′))(ptr_val2′)
{-5}   (array?(typ(cv_base(typ′))) ⊃ size_of(typ(cv_base(typ′))) > 0)
{-6}   not_null?(typ′)(ptr_val1′)
{-7}   not_null?(typ′)(ptr_val2′)
{-8}   same_array(typ′)(ptr_val1′, ptr_val2′)
{-9}   up?(address_of(typ′)(ptr_val1′))
{-10}  up?(address_of(typ′)(ptr_val2′))
-------------------------------------------------------------------
 {1}   extend[Cpp_Type_, (pointer?), bool, FALSE]
         (λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p)))
         (cv_base(typ′))
 {2}   size_of(typ(cv_base(typ′))) > 0
```

Keeping (-2 1) and hiding *,
Using lemma cv_base_result,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC4.2`.
Q.E.D.

C.11.27 ArithmeticExpressions.minus_ptr_ptr_TCC5

Terse proof for `minus_ptr_ptr_TCC5`.

`minus_ptr_ptr_TCC5`:

```
-------------------------------------------------------------------
{1}  ∀ (typ:
          Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                              (λ (p: (pointer?)):
                                  ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))),
        ptr_val1: (range_pointer(cv_base(typ))),
        ptr_val2: (range_pointer(cv_base(typ))):
       (array?(typ(cv_base(typ))) ⊃ size_of(typ(cv_base(typ))) > 0) ∧
        not_null?(typ)(ptr_val1) ∧
         not_null?(typ)(ptr_val2) ∧
          same_array(typ)(ptr_val1, ptr_val2) ∧
           up?(address_of(typ)(ptr_val1)) ∧ up?(address_of(typ)(ptr_val2))
       ⊃
       (∀ (difference:
             {q: int |
                   offset(down [Memory_Address](address_of(typ)(ptr_val1))) − offset(down
                    =
                    rem(size_of(typ(cv_base(typ))))(offset(down [Memory_Address](address
        difference =
         ndiv(offset(down(address_of(typ)(ptr_val1))) − offset(down(address_of(typ)(ptr_val2))),
              size_of(typ(cv_base(typ))))
        ⊃ Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int))
```

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:
`minus_ptr_ptr_TCC5.1:`

{1} Cpp_Type?(int)

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Expanding the definition of subterm,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC5.1`.
`minus_ptr_ptr_TCC5.2:`

{1} cv(non_bool_integral_enum?)(int)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC5.2`.
Q.E.D.

C.11.28 ArithmeticExpressions.minus_ptr_ptr_TCC6

Terse proof for `minus_ptr_ptr_TCC6`.
`minus_ptr_ptr_TCC6:`

{1} ∀ (typ:
Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
(λ (p: (pointer?)):
¬ void?(typ(p)) ∧ ¬ function?(typ(p)))),
ptr_val1: (range_pointer(cv_base(typ))),
ptr_val2: (range_pointer(cv_base(typ)))):
¬ ((array?(typ(cv_base(typ))) ⊃ size_of(typ(cv_base(typ))) > 0) ∧
not_null?(typ)(ptr_val1) ∧
not_null?(typ)(ptr_val2) ∧
same_array(typ)(ptr_val1, ptr_val2) ∧
up?(address_of(typ)(ptr_val1)) ∧ up?(address_of(typ)(ptr_val2)))
⊃ Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)

Repeatedly Skolemizing and flattening,
Keeping (2) and hiding *,
Applying propositional simplification,
we get 2 subgoals:

`minus_ptr_ptr_TCC6.1`:

{1} Cpp_Type?(int)

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Expanding the definition of subterm,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_par no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC6.1`.
`minus_ptr_ptr_TCC6.2`:

{1} cv(non_bool_integral_enum?)(int)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC6.2`.
Q.E.D.

C.11.29 ArithmeticExpressions.minus_ptr_ptr_TCC7

Terse proof for `minus_ptr_ptr_TCC7`.
`minus_ptr_ptr_TCC7`:

{1} ∀ (typ:
Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
(λ (p: (pointer?)):
¬ void?(typ(p)) ∧ ¬ function?(typ(p)))),
ptr_val1: (range_pointer(cv_base(typ)))):
pointer?(cv_base(typ))

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:
`minus_ptr_ptr_TCC7.1`:

{-1} Cpp_Type?(typ′)
{-2} cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
(λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))
(typ′)
{-3} range_pointer(cv_base(typ′))(ptr_val1′)

{1} cv(pointer?)(typ′)
{2} pointer?(cv_base(typ′))

Keeping (-2 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC7.1`.

`minus_ptr_ptr_TCC7.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
             (λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))
        (typ′)
{-3}  range_pointer(cv_base(typ′))(ptr_val1′)
-------------------------------------------------------------------------
{1}   (pointer? ⊆ interpreted?)
{2}   pointer?(cv_base(typ′))
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC7.2`.
Q.E.D.

C.11.30 ArithmeticExpressions.minus_ptr_ptr_TCC8

Terse proof for `minus_ptr_ptr_TCC8`.
`minus_ptr_ptr_TCC8:`

```
{1}   ∀ (typ:
            Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                                 (λ (p: (pointer?)):
                                      ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))),
          ptr_val1: (range_pointer(cv_base(typ)))):
        Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)
```

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:
`minus_ptr_ptr_TCC8.1:`

```
{1}   Cpp_Type?(int)
```

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Expanding the definition of subterm,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC8.1`.
`minus_ptr_ptr_TCC8.2:`

```
{1}   cv(non_bool_integral_enum?)(int)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `minus_ptr_ptr_TCC8.2`.
Q.E.D.

C.11.31 ArithmeticExpressions.minus_ptr_ptr_TCC9

Terse proof for `minus_ptr_ptr_TCC9`.
`minus_ptr_ptr_TCC9:`

```
{1}  ∀ (typ:
           Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                                (λ (p: (pointer?)):
                                     ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))):
       pointer?(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:
`minus_ptr_ptr_TCC9.1:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                (λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))
        (typ′)
------------------------------------------------------------------------
{1}   cv(pointer?)(typ′)
{2}   pointer?(cv_base(typ′))
```

Keeping (-2 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC9.1`.
`minus_ptr_ptr_TCC9.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                (λ (p: (pointer?)): ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))
        (typ′)
------------------------------------------------------------------------
{1}   (pointer? ⊆ interpreted?)
{2}   pointer?(cv_base(typ′))
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC9.2`.
Q.E.D.

C.11.32 ArithmeticExpressions.minus_ptr_ptr_TCC10

Terse proof for `minus_ptr_ptr_TCC10`.
`minus_ptr_ptr_TCC10:`

```
{1}  ∀ (typ:
           Cpp_Subtype(cv(extend[Cpp_Type_, (pointer?), bool, FALSE]
                                (λ (p: (pointer?)):
                                     ¬ void?(typ(p)) ∧ ¬ function?(typ(p))))):
       Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)
```

Repeatedly Skolemizing and flattening,
Keeping (1) and hiding *,
Applying propositional simplification,
we get 2 subgoals:
`minus_ptr_ptr_TCC10.1:`

{1} Cpp_Type?(int)

Expanding the definition of Cpp_Type?,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC10.1`.
`minus_ptr_ptr_TCC10.2:`

{1} cv(non_bool_integral_enum?)(int)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `minus_ptr_ptr_TCC10.2`.
Q.E.D.

C.11.33 ArithmeticExpressions.cmp_pointer_TCC1

Terse proof for `cmp_pointer_TCC1`.
`cmp_pointer_TCC1:`

{1} ∀ (p_typ: Cpp_Subtype(cv(pointer?)), ptr_val1: (range_pointer(cv_base(p_typ)))): pointer?(cv_base(p_typ))

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cmp_pointer_TCC1`.
Q.E.D.

C.11.34 ArithmeticExpressions.cmp_pointer_TCC2

Terse proof for `cmp_pointer_TCC2`.
`cmp_pointer_TCC2:`

{1} ∀ (p_typ: Cpp_Subtype(cv(pointer?))): pointer?(cv_base(p_typ))

Repeatedly Skolemizing and flattening,

Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cmp_pointer_TCC2`.
Q.E.D.

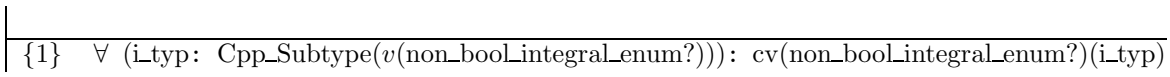
C.12 Proofs for AssemblerStatements (statements.pvs)

This theory contains no provable formal statements.

C.13 Proofs for AssignmentExpressions (expressions.pvs)

C.13.1 AssignmentExpressions.assign_times_TCC1

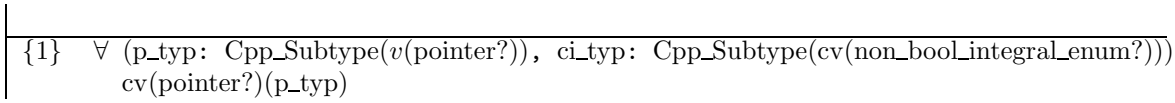
Terse proof for `assign_times_TCC1`.
`assign_times_TCC1:`



Repeatedly Skolemizing and flattening,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `assign_times_TCC1`.
Q.E.D.

C.13.2 AssignmentExpressions.assign_plus_ptr_TCC1

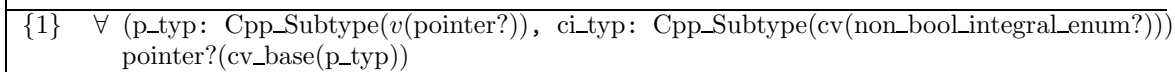
Terse proof for `assign_plus_ptr_TCC1`.
`assign_plus_ptr_TCC1:`



Repeatedly Skolemizing and flattening,
Keeping (-2 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `assign_plus_ptr_TCC1`.
Q.E.D.

C.13.3 AssignmentExpressions.assign_plus_ptr_TCC2

Terse proof for `assign_plus_ptr_TCC2`.
`assign_plus_ptr_TCC2:`



Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,

we get 2 subgoals:
`assign_plus_ptr_TCC2.1:`

{-1}	Cpp_Type?(p_typ′)
{-2}	v(pointer?)(p_typ′)
{-3}	Cpp_Type?(ci_typ′)
{-4}	cv(non_bool_integral_enum?)(ci_typ′)
{1}	cv(pointer?)(p_typ′)
{2}	pointer?(cv_base(p_typ′))

Using lemma assign_plus_ptr_TCC1,
This completes the proof of `assign_plus_ptr_TCC2.1`.
`assign_plus_ptr_TCC2.2:`

{-1}	Cpp_Type?(p_typ′)
{-2}	v(pointer?)(p_typ′)
{-3}	Cpp_Type?(ci_typ′)
{-4}	cv(non_bool_integral_enum?)(ci_typ′)
{1}	(pointer? $\subseteq$ interpreted?)
{2}	pointer?(cv_base(p_typ′))

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `assign_plus_ptr_TCC2.2`.
Q.E.D.

C.14 Proofs for AssignmentExpressions2 (expressions.pvs)

This theory contains no provable formal statements.

C.15 Proofs for Bitlist_ops (bits.pvs)

C.15.1 Bitlist_ops.binary_not_TCC1

Terse proof for `binary_not_TCC1`.
`binary_not_TCC1:`

{1}	$(\forall\ (x\colon \text{nat})\colon x < \text{expt}(2,\ \text{bits\_per\_byte}) \equiv x < \text{max\_byte}) \wedge$ $(\forall\ (x_1\colon \text{below}[\text{expt}(2,\ \text{bits\_per\_byte})])\colon \text{binary\_not}[\text{bits\_per\_byte}](x_1) < \text{max\_byte})$

Expanding the definition of max_byte,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_not_TCC1`.
Q.E.D.

C.15.2 Bitlist_ops.binary_and_TCC1

Terse proof for `binary_and_TCC1`.

`binary_and_TCC1:`

{1} $(\forall\ (x\colon\ \text{nat})\colon\ x < \text{expt}(2,\ \text{bits\_per\_byte}) \equiv x < \text{max\_byte}) \wedge$
$(\forall\ (x_1\colon\ [\text{below}[\text{expt}(2,\ \text{bits\_per\_byte})],\ \text{below}[\text{expt}(2,\ \text{bits\_per\_byte})]])\colon$
$\text{binary\_and}[\text{bits\_per\_byte}](x_1) < \text{max\_byte})$

Expanding the definition of max_byte,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_and_TCC1`.
Q.E.D.

C.15.3 Bitlist_ops.binary_or_TCC1

Terse proof for `binary_or_TCC1`.
`binary_or_TCC1:`

{1} $(\forall\ (x\colon\ \text{nat})\colon\ x < \text{expt}(2,\ \text{bits\_per\_byte}) \equiv x < \text{max\_byte}) \wedge$
$(\forall\ (x_1\colon\ [\text{below}[\text{expt}(2,\ \text{bits\_per\_byte})],\ \text{below}[\text{expt}(2,\ \text{bits\_per\_byte})]])\colon$
$\text{binary\_or}[\text{bits\_per\_byte}](x_1) < \text{max\_byte})$

Expanding the definition of max_byte,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_or_TCC1`.
Q.E.D.

C.15.4 Bitlist_ops.binary_xor_TCC1

Terse proof for `binary_xor_TCC1`.
`binary_xor_TCC1:`

{1} $(\forall\ (x\colon\ \text{nat})\colon\ x < \text{expt}(2,\ \text{bits\_per\_byte}) \equiv x < \text{max\_byte}) \wedge$
$(\forall\ (x_1\colon\ [\text{below}[\text{expt}(2,\ \text{bits\_per\_byte})],\ \text{below}[\text{expt}(2,\ \text{bits\_per\_byte})]])\colon$
$\text{binary\_xor}[\text{bits\_per\_byte}](x_1) < \text{max\_byte})$

Expanding the definition of max_byte,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_xor_TCC1`.
Q.E.D.

C.15.5 Bitlist_ops.singleton_zero_mask

Terse proof for `singleton_zero_mask`.
`singleton_zero_mask:`

{1} $\forall\ (s\colon\ \text{nat})\colon\ \text{singleton?}(\text{zero\_mask?}(s))$

Inducting on s on formula 1,
we get 2 subgoals:

`singleton_zero_mask.1:`

{1} singleton?(zero_mask?(0))

Expanding the definition of zero_mask?,
Expanding the definition of length,
Expanding the definition of singleton?,
Instantiating quantified variables,
we get 3 subgoals:
`singleton_zero_mask.1.1:`

{1} ∀ (y_1:
(λ (l: list[Byte]):
CASES l OF null: 0, cons(x, y): length(y) + 1 ENDCASES = 0 ∧
every(λ (t: Byte): t = 0)(l))):
null = y_1

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `singleton_zero_mask.1.1`.
`singleton_zero_mask.1.2:`

{1} every[Byte](λ (t: Byte): t = 0)(null[Byte])

Expanding the definition of every,
which is trivially true.
This completes the proof of `singleton_zero_mask.1.2`.
`singleton_zero_mask.1.3:`

{1} every[Byte](λ (t: Byte): t = 0)(null[Byte])
{2} ∃ (x_1:
(λ (l: list[Byte]):
CASES l OF null: 0, cons(x, y): length(y) + 1 ENDCASES = 0 ∧
every(λ (t: Byte): t = 0)(l))):
∀ (y_1:
(λ (l: list[Byte]):
CASES l OF null: 0, cons(x, y): length(y) + 1 ENDCASES = 0 ∧
every(λ (t: Byte): t = 0)(l))):
x_1 = y_1

Expanding the definition of every,
which is trivially true.
This completes the proof of `singleton_zero_mask.1.3`.
`singleton_zero_mask.2:`

{1} ∀ j: singleton?(zero_mask?(j)) ⊃ singleton?(zero_mask?(j + 1))

Repeatedly Skolemizing and flattening,
Expanding the definition of zero_mask?,
Expanding the definition of singleton?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (cons(0, x!1)),

we get 3 subgoals:

`singleton_zero_mask.2.1:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (x′)
{-2}  length(x′) = j′
{-3}  every(λ (t: Byte): t = 0)(x′)
{-4}  j′ ≥ 0
{-5}  ∀ (y:
           (λ (l: list[Byte]):
              length(l) = j′ ∧ every(λ (t: Byte): t = 0)(l))):
        x′ = y
------------------------------------------------------------------------
{1}   ∀ (y:
           (λ (l: list[Byte]):
              length(l) = 1 + j′ ∧ every(λ (t: Byte): t = 0)(l))):
        cons(0, x′) = y
```

Repeatedly Skolemizing and flattening,

Case splitting on null?(y!1),

we get 2 subgoals:

`singleton_zero_mask.2.1.1:`

```
{-1}  null?(y′)
{-2}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (y′)
{-3}  length(y′) = 1 + j′
{-4}  every(λ (t: Byte): t = 0)(y′)
{-5}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (x′)
{-6}  length(x′) = j′
{-7}  every(λ (t: Byte): t = 0)(x′)
{-8}  j′ ≥ 0
{-9}  ∀ (y:
           (λ (l: list[Byte]):
              length(l) = j′ ∧ every(λ (t: Byte): t = 0)(l))):
        x′ = y
------------------------------------------------------------------------
{1}   cons(0, x′) = y′
```

Expanding the definition of length,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `singleton_zero_mask.2.1.1`.

`singleton_zero_mask.2.1.2:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (y′)
{-2}  length(y′) = 1 + j′
{-3}  every(λ (t: Byte): t = 0)(y′)
{-4}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (x′)
{-5}  length(x′) = j′
{-6}  every(λ (t: Byte): t = 0)(x′)
{-7}  j′ ≥ 0
{-8}  ∀ (y:
            (λ (l: list[Byte]):
               length(l) = j′ ∧ every(λ (t: Byte): t = 0)(l))):
        x′ = y
|-----
{1}   null?(y′)
{2}   cons(0, x′) = y′
```

Expanding the definition of length,
Simplifying, rewriting, and recording with decision procedures,
Instantiating the top quantifier in -8 with the terms: (cdr(y!1)),
we get 2 subgoals:
`singleton_zero_mask.2.1.2.1:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (y′)
{-2}  length(cdr(y′)) = j′
{-3}  every(λ (t: Byte): t = 0)(y′)
{-4}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (x′)
{-5}  CASES x′ OF null: 0, cons(x, y): length(y) + 1 ENDCASES = j′
{-6}  every(λ (t: Byte): t = 0)(x′)
{-7}  j′ ≥ 0
{-8}  x′ = cdr(y′)
|-----
{1}   null?(y′)
{2}   cons(0, x′) = y′
```

Expanding the definition of every,
Replacing using formula -8,
Using lemma list_cons_eta,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `singleton_zero_mask.2.1.2.1`.

`singleton_zero_mask.2.1.2.2:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (y′)
{-2}  length(cdr(y′)) = j′
{-3}  every(λ (t: Byte): t = 0)(y′)
{-4}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (x′)
{-5}  CASES x′ OF null: 0, cons(x, y): length(y) + 1 ENDCASES = j′
{-6}  every(λ (t: Byte): t = 0)(x′)
{-7}  j′ ≥ 0
------------------------------------------------------------------------
{1}   every[Byte](λ (t: Byte): t = 0)(cdr[Byte](y′))
{2}   null?(y′)
{3}   cons(0, x′) = y′
```

Expanding the definition of every,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `singleton_zero_mask.2.1.2.2`.

`singleton_zero_mask.2.2:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
          (x′)
{-2}  length(x′) = j′
{-3}  every(λ (t: Byte): t = 0)(x′)
{-4}  j′ ≥ 0
{-5}  ∀ (y:
           (λ (l: list[Byte]):
                length(l) = j′ ∧ every(λ (t: Byte): t = 0)(l))):
        x′ = y
------------------------------------------------------------------------
{1}   length[Byte](cons[Byte](0, x′)) = 1 + j′ ∧
       every[Byte](λ (t: Byte): t = 0)(cons[Byte](0, x′))
```

Expanding the definition of length,

Expanding the definition of every,

which is trivially true.

This completes the proof of `singleton_zero_mask.2.2`.

singleton_zero_mask.2.3:

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧ integer_pred(x) ∧ x ≥ 0 ∧ x < max_byte)
        (x′)
{-2}  length(x′) = j′
{-3}  every(λ (t: Byte): t = 0)(x′)
{-4}  j′ ≥ 0
{-5}  ∀ (y:
           (λ (l: list[Byte]):
              length(l) = j′ ∧ every(λ (t: Byte): t = 0)(l))):
        x′ = y
|-------
{1}   0 < max_byte
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of singleton_zero_mask.2.3.
Q.E.D.

C.15.6 Bitlist_ops.bit_set?_TCC1

Terse proof for bit_set?_TCC1.

bit_set?_TCC1:

```
|-------
{1}   ∀ (n: nat, l: list[Byte]): n < length(l) × max_byte ⊃ max_byte > 0
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of bit_set?_TCC1.
Q.E.D.

C.15.7 Bitlist_ops.bit_set?_TCC2

Terse proof for bit_set?_TCC2.

bit_set?_TCC2:

```
|-------
{1}   ∀ (n: nat, l: list[Byte]):
        n < length(l) × max_byte ⊃ ndiv(n, max_byte) < length[Byte](l)
```

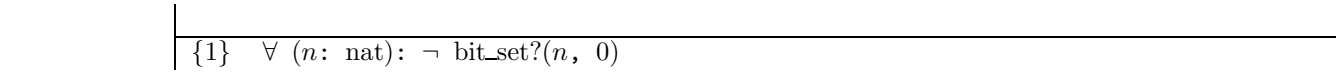
Repeatedly Skolemizing and flattening,
Using lemma ndiv_lt,
Using lemma both_sides_div_pos_lt1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of bit_set?_TCC2.
Q.E.D.

C.16 Proofs for Bitops (bits.pvs)

C.16.1 Bitops.bit_set_zero_mask

Terse proof for bit_set_zero_mask.

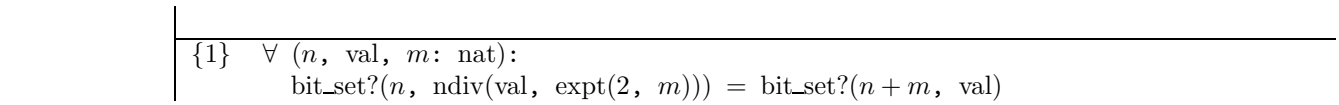
`bit_set_zero_mask:`



Expanding the definition of bit_set?,
Repeatedly Skolemizing and flattening,
Rewriting using cut_bit_zero, matching in *,
This completes the proof of `bit_set_zero_mask`.
Q.E.D.

C.16.2 Bitops.bit_set_ndiv_expt2

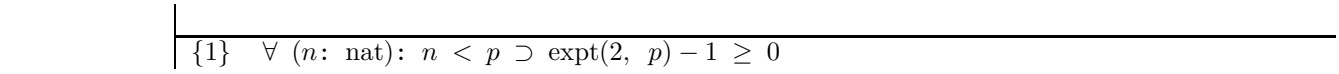
Terse proof for `bit_set_ndiv_expt2`.
`bit_set_ndiv_expt2:`



Repeatedly Skolemizing and flattening,
Expanding the definition of bit_set?,
Expanding the definition of cut_bit,
Using lemma ndiv_times_2,
Rewriting using expt_plus_aux, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `bit_set_ndiv_expt2`.
Q.E.D.

C.16.3 Bitops.bit_set_full_mask_TCC1

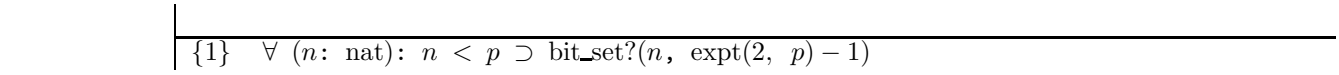
Terse proof for `bit_set_full_mask_TCC1`.
`bit_set_full_mask_TCC1:`



Repeatedly Skolemizing and flattening,
Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bit_set_full_mask_TCC1`.
Q.E.D.

C.16.4 Bitops.bit_set_full_mask

Terse proof for `bit_set_full_mask`.
`bit_set_full_mask:`



Repeatedly Skolemizing and flattening,
Expanding the definition of bit_set?,
Expanding the definition of cut_bit,
Using lemma ndiv_plus_1,

Case splitting on divides(expt(2, n!1), expt(2, p)),

we get 2 subgoals:

`bit_set_full_mask.1:`

$$
\begin{array}{ll}
\{\text{-1}\} & \text{divides}(\text{expt}(2,\ n'),\ \text{expt}(2,\ p)) \\
\{\text{-2}\} & \text{divides}(\text{expt}(2,\ n'),\ \text{expt}(2,\ p)) \supset \\
 & \quad \text{ndiv}(\text{expt}(2,\ p) + -1,\ \text{expt}(2,\ n')) = \\
 & \quad\quad \text{ndiv}(\text{expt}(2,\ p),\ \text{expt}(2,\ n')) + \text{ndiv}(-1,\ \text{expt}(2,\ n')) \\
\{\text{-3}\} & n' \geq 0 \\
\{\text{-4}\} & n' < p \\
\hline
\{1\} & \text{rem}(2)(\text{ndiv}(\text{expt}(2,\ p) - 1,\ \text{expt}(2,\ n'))) = 1
\end{array}
$$

Simplifying, rewriting, and recording with decision procedures,

Replacing using formula -2,

Rewriting using ndiv_expt_expt, matching in *,

Using lemma rem_sum1,

Replacing using formula -1,

Expanding the definition of expt,

Rewriting using rem_multiple1, matching in *,

Simplifying, rewriting, and recording with decision procedures,

Using lemma rem_def,

Using lemma ndiv_plus_2,

Rewriting using divides_reflexive, matching in *,

Rewriting using ndiv_self, matching in *,

Rewriting using ndiv_bigger, matching in *,

we get 2 subgoals:

`bit_set_full_mask.1.1:`

$$
\begin{array}{ll}
\{\text{-1}\} & 0 = \text{ndiv}(-1,\ \text{expt}(2,\ n')) + 1 \\
\{\text{-2}\} & \text{rem}(2)(\text{ndiv}(-1,\ \text{expt}(2,\ n'))) = 1 \equiv \\
 & \quad (\exists\ q\text{:}\ \text{ndiv}(-1,\ \text{expt}(2,\ n')) = 2 \times q + 1) \\
\{\text{-3}\} & \text{rem}(2)(\text{rem}(2)(\text{expt}(2,\ p - n')) + \text{ndiv}(-1,\ \text{expt}(2,\ n'))) = \\
 & \quad \text{rem}(2)(\text{ndiv}(-1,\ \text{expt}(2,\ n')) + \text{expt}(2,\ p - n')) \\
\{\text{-4}\} & \text{divides}(\text{expt}(2,\ n'),\ \text{expt}(2,\ p)) \\
\{\text{-5}\} & \text{ndiv}(\text{expt}(2,\ p) - 1,\ \text{expt}(2,\ n')) = \\
 & \quad \text{ndiv}(-1,\ \text{expt}(2,\ n')) + \text{expt}(2,\ p - n') \\
\{\text{-6}\} & n' \geq 0 \\
\{\text{-7}\} & n' < p \\
\hline
\{1\} & \text{rem}(2)(\text{ndiv}(-1,\ \text{expt}(2,\ n'))) = 1
\end{array}
$$

Using lemma both_sides_plus1,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Replacing using formula -2,

Instantiating the top quantifier in 2 with the terms: (-1),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bit_set_full_mask.1.1`.

`bit_set_full_mask.1.2:`

{-1}	$\mathrm{ndiv}(\mathrm{expt}(2,\ n') - 1,\ \mathrm{expt}(2,\ n')) = 1 + \mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n'))$
{-2}	$\mathrm{rem}(2)(\mathrm{rem}(2)(\mathrm{expt}(2,\ p - n')) + \mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n'))) =$ $\mathrm{rem}(2)(\mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n')) + \mathrm{expt}(2,\ p - n'))$
{-3}	$\mathrm{divides}(\mathrm{expt}(2,\ n'),\ \mathrm{expt}(2,\ p))$
{-4}	$\mathrm{ndiv}(\mathrm{expt}(2,\ p) - 1,\ \mathrm{expt}(2,\ n')) =$ $\mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n')) + \mathrm{expt}(2,\ p - n')$
{-5}	$n' \geq 0$
{-6}	$n' < p$
{1}	$\mathrm{expt}(2,\ n') - 1 \geq 0$
{2}	$\exists\ q\colon\ \mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n')) = 1 + 2 \times q$
{3}	$\mathrm{rem}(2)(\mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n'))) = 1$

Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bit_set_full_mask.1.2`.
`bit_set_full_mask.2:`

{-1}	$\mathrm{divides}(\mathrm{expt}(2,\ n'),\ \mathrm{expt}(2,\ p)) \supset$ $\mathrm{ndiv}(\mathrm{expt}(2,\ p) + -1,\ \mathrm{expt}(2,\ n')) =$ $\mathrm{ndiv}(\mathrm{expt}(2,\ p),\ \mathrm{expt}(2,\ n')) + \mathrm{ndiv}(-1,\ \mathrm{expt}(2,\ n'))$
{-2}	$n' \geq 0$
{-3}	$n' < p$
{1}	$\mathrm{divides}(\mathrm{expt}(2,\ n'),\ \mathrm{expt}(2,\ p))$
{2}	$\mathrm{rem}(2)(\mathrm{ndiv}(\mathrm{expt}(2,\ p) - 1,\ \mathrm{expt}(2,\ n'))) = 1$

Hiding formulas: (-1 2),
Expanding the definition of divides,
Instantiating the top quantifier in 1 with the terms: (expt(2, p - n!1)),
we get 2 subgoals:
`bit_set_full_mask.2.1:`

{-1}	$n' \geq 0$
{-2}	$n' < p$
{1}	$\mathrm{expt}(2,\ p) = \mathrm{expt}(2,\ n') \times \mathrm{expt}(2,\ p - n')$

Using lemma expt_plus_aux,
we get 2 subgoals:
`bit_set_full_mask.2.1.1:`

{-1}	$\mathrm{expt}(2,\ n' + p - n') = \mathrm{expt}(2,\ n') \times \mathrm{expt}(2,\ p - n')$
{-2}	$n' \geq 0$
{-3}	$n' < p$
{1}	$\mathrm{expt}(2,\ p) = \mathrm{expt}(2,\ n') \times \mathrm{expt}(2,\ p - n')$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bit_set_full_mask.2.1.1`.
`bit_set_full_mask.2.1.2:`

{-1}	$n' \geq 0$
{-2}	$n' < p$
{1}	$p - n' \geq 0$
{2}	$\mathrm{expt}(2,\ p) = \mathrm{expt}(2,\ n') \times \mathrm{expt}(2,\ p - n')$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bit_set_full_mask.2.1.2`.

`bit_set_full_mask.2.2`:

$$\begin{array}{ll} \{\text{-1}\} & n' \geq 0 \\ \{\text{-2}\} & n' < p \\ \hline \{1\} & p - n' \geq 0 \end{array}$$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bit_set_full_mask.2.2`.

Q.E.D.

C.16.5 Bitops.bits_equal

Terse proof for `bits_equal`.

`bits_equal`:

$$\begin{array}{ll} \{1\} & \forall\ (v_1,\ v_2,\ p\colon \text{nat})\colon \\ & \quad (\forall\ (n\colon \text{nat})\colon n < p \supset \text{bit\_set?}(n,\ v_1) = \text{bit\_set?}(n,\ v_2)) \supset \\ & \quad\ \text{rem}(\text{expt}(2,\ p))(v_1) = \text{rem}(\text{expt}(2,\ p))(v_2) \end{array}$$

Inducting on p on formula 1,

we get 2 subgoals:

`bits_equal.1`:

$$\begin{array}{ll} \{1\} & \forall\ (v_1,\ v_2\colon \text{nat})\colon \\ & \quad (\forall\ (n\colon \text{nat})\colon n < 0 \supset \text{bit\_set?}(n,\ v_1) = \text{bit\_set?}(n,\ v_2)) \supset \\ & \quad\ \text{rem}(\text{expt}(2,\ 0))(v_1) = \text{rem}(\text{expt}(2,\ 0))(v_2) \end{array}$$

Repeatedly Skolemizing and flattening,

Expanding the definition of expt,

Rewriting using rem_def, matching in *,

Instantiating the top quantifier in 1 with the terms: (v1!1 - rem(1)(v2!1)),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bits_equal.1`.

`bits_equal.2`:

$$\begin{array}{ll} \{1\} & \forall\ j\colon \\ & \quad (\forall\ (v_1,\ v_2\colon \text{nat})\colon \\ & \qquad (\forall\ (n\colon \text{nat})\colon n < j \supset \text{bit\_set?}(n,\ v_1) = \text{bit\_set?}(n,\ v_2)) \supset \\ & \qquad\ \text{rem}(\text{expt}(2,\ j))(v_1) = \text{rem}(\text{expt}(2,\ j))(v_2)) \\ & \quad \supset \\ & \quad (\forall\ (v_1,\ v_2\colon \text{nat})\colon \\ & \qquad (\forall\ (n\colon \text{nat})\colon n < j+1 \supset \text{bit\_set?}(n,\ v_1) = \text{bit\_set?}(n,\ v_2)) \supset \\ & \qquad\ \text{rem}(\text{expt}(2,\ j+1))(v_1) = \text{rem}(\text{expt}(2,\ j+1))(v_2)) \end{array}$$

Repeatedly Skolemizing and flattening,

Instantiating the top quantifier in -4 with the terms: (v1!1 v2!1),

Splitting conjunctions,

we get 2 subgoals:

`bits_equal.2.1:`

{-1}	$\text{rem}(\text{expt}(2,\ j'))(v_1') = \text{rem}(\text{expt}(2,\ j'))(v_2')$
{-2}	$v_1' \geq 0$
{-3}	$v_2' \geq 0$
{-4}	$j' \geq 0$
{-5}	$\forall\ (n\text{: nat}):\ n < j'+1 \supset \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$
{1}	$\text{rem}(\text{expt}(2,\ j'+1))(v_1') = \text{rem}(\text{expt}(2,\ j'+1))(v_2')$

Expanding the definition of expt,
Expanding the definition of bit_set?,
Expanding the definition of cut_bit,
Using lemma rem_prod_3,
Using lemma rem_prod_3,
Replacing using formula -1,
Replacing using formula -2,
Replacing using formula -3,
Instantiating the top quantifier in -7 with the terms: (j!1),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bits_equal.2.1`.
`bits_equal.2.2:`

{-1}	$v_1' \geq 0$
{-2}	$v_2' \geq 0$
{-3}	$j' \geq 0$
{-4}	$\forall\ (n\text{: nat}):\ n < j'+1 \supset \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$
{1}	$\forall\ (n\text{: nat}):\ n < j' \supset \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$
{2}	$\text{rem}(\text{expt}(2,\ j'+1))(v_1') = \text{rem}(\text{expt}(2,\ j'+1))(v_2')$

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -6 with the terms: (n!1),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bits_equal.2.2`.
Q.E.D.

C.16.6 Bitops.bits_equal2

Terse proof for `bits_equal2`.
`bits_equal2:`

{1}	$\forall\ (v_1,\ v_2\text{: below}\lfloor\text{expt}(2,\ p)\rfloor):$ $(\forall\ (n\text{: nat}):\ n < p \supset \text{bit\_set?}(n,\ v_1) = \text{bit\_set?}(n,\ v_2)) \equiv v_1 = v_2$

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
`bits_equal2.1:`

{-1}	$\forall\ (n\text{: nat}):\ n < p \supset \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$
{-2}	$v_1' < \text{expt}(2,\ p)$
{-3}	$v_2' < \text{expt}(2,\ p)$
{1}	$v_1' = v_2'$

Using lemma bits_equal,
Replacing using formula -2,

Rewriting using rem_mod, matching in *,

Rewriting using rem_mod, matching in *,

This completes the proof of `bits_equal2.1`.

`bits_equal2.2`:

$$\begin{array}{ll}
\{\text{-1}\} & v_1' = v_2' \\
\{\text{-2}\} & v_1' < \text{expt}(2, p) \\
\{\text{-3}\} & v_2' < \text{expt}(2, p) \\
\hline
\{1\} & \forall\ (n\text{: nat})\text{: } n < p \supset \text{bit_set?}(n, v_1') = \text{bit_set?}(n, v_2')
\end{array}$$

Repeatedly Skolemizing and flattening,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bits_equal2.2`.

Q.E.D.

C.16.7 Bitops.bits_equal3

Terse proof for `bits_equal3`.

`bits_equal3`:

$$\begin{array}{ll}
 & \\
\hline
\{1\} & \forall\ (v_1, v_2\text{: nat})\text{: } (\forall\ (n\text{: nat})\text{: } \text{bit_set?}(n, v_1) = \text{bit_set?}(n, v_2)) \supset v_1 = v_2
\end{array}$$

Repeatedly Skolemizing and flattening,

Applying bits_equal

Case splitting on EXISTS (x: posnat): v1!1 < expt(2, x) AND v2!1 < expt(2, x),

we get 2 subgoals:

`bits_equal3.1`:

$$\begin{array}{ll}
\{\text{-1}\} & \exists\ (x\text{: posnat})\text{: } v_1' < \text{expt}(2, x) \wedge v_2' < \text{expt}(2, x) \\
\{\text{-2}\} & \forall\ (v_1, v_2, p\text{: nat})\text{:} \\
 & \quad (\forall\ (n\text{: nat})\text{: } n < p \supset \text{bit_set?}(n, v_1) = \text{bit_set?}(n, v_2)) \supset \\
 & \quad \text{rem}(\text{expt}(2, p))(v_1) = \text{rem}(\text{expt}(2, p))(v_2) \\
\{\text{-3}\} & v_1' \geq 0 \\
\{\text{-4}\} & v_2' \geq 0 \\
\{\text{-5}\} & \forall\ (n\text{: nat})\text{: } \text{bit_set?}(n, v_1') = \text{bit_set?}(n, v_2') \\
\hline
\{1\} & v_1' = v_2'
\end{array}$$

Instantiating the top quantifier in -2 with the terms: (v1!1 v2!1 choose({p: posnat | v1!1 < expt(2, p) AND v2!1 < expt(2, p)})),

we get 2 subgoals:

`bits_equal3.1.1:`

{-1} $\exists\ (x\colon \text{posnat})\colon v_1' < \text{expt}(2,\ x) \wedge v_2' < \text{expt}(2,\ x)$
{-2} $(\forall\ (n\colon \text{nat})\colon$
$n < \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\}) \supset$
$\text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2'))$
$\supset$
$\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_1')
$=$
$\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_2')
{-3} $v_1' \geq 0$
{-4} $v_2' \geq 0$
{-5} $\forall\ (n\colon \text{nat})\colon \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$

{1} $v_1' = v_2'$

Splitting conjunctions,
we get 2 subgoals:
`bits_equal3.1.1.1:`

{-1} $\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_1')
$=$
$\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_2')
{-2} $\exists\ (x\colon \text{posnat})\colon v_1' < \text{expt}(2,\ x) \wedge v_2' < \text{expt}(2,\ x)$
{-3} $v_1' \geq 0$
{-4} $v_2' \geq 0$
{-5} $\forall\ (n\colon \text{nat})\colon \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$

{1} $v_1' = v_2'$

Using lemma rem_mod,
we get 3 subgoals:
`bits_equal3.1.1.1.1:`

{-1} $\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_1')
$= v_1'$
{-2} $\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_1')
$=$
$\text{rem}(\text{expt}(2,\ \text{choose}(\{p\colon \text{posnat} \mid v_1' < \text{expt}(2,\ p) \wedge v_2' < \text{expt}(2,\ p)\})))$
(v_2')
{-3} $\exists\ (x\colon \text{posnat})\colon v_1' < \text{expt}(2,\ x) \wedge v_2' < \text{expt}(2,\ x)$
{-4} $v_1' \geq 0$
{-5} $v_2' \geq 0$
{-6} $\forall\ (n\colon \text{nat})\colon \text{bit\_set?}(n,\ v_1') = \text{bit\_set?}(n,\ v_2')$

{1} $v_1' = v_2'$

Replacing using formula -1,
Hiding formulas: -1,
Using lemma rem_mod,
we get 3 subgoals:

`bits_equal3.1.1.1.1.1:`

```
{-1}  rem(expt(2, choose({p: posnat | v'1 < expt(2, p) ∧ v'2 < expt(2, p)})))
        (v'2)
      = v'2
{-2}  v'1 =
      rem(expt(2, choose({p: posnat | v'1 < expt(2, p) ∧ v'2 < expt(2, p)})))
        (v'2)
{-3}  ∃ (x: posnat): v'1 < expt(2, x) ∧ v'2 < expt(2, x)
{-4}  v'1 ≥ 0
{-5}  v'2 ≥ 0
{-6}  ∀ (n: nat): bit_set?(n, v'1) = bit_set?(n, v'2)
------------------------------------------------------------------------
{1}   v'1 = v'2
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bits_equal3.1.1.1.1.1`.

`bits_equal3.1.1.1.1.2:`

```
{-1}  v'1 =
      rem(expt(2, choose({p: posnat | v'1 < expt(2, p) ∧ v'2 < expt(2, p)})))
        (v'2)
{-2}  ∃ (x: posnat): v'1 < expt(2, x) ∧ v'2 < expt(2, x)
{-3}  v'1 ≥ 0
{-4}  v'2 ≥ 0
{-5}  ∀ (n: nat): bit_set?(n, v'1) = bit_set?(n, v'2)
------------------------------------------------------------------------
{1}   v'2 <
      expt(2, choose[posnat]({p: posnat | v'1 < expt(2, p) ∧ v'2 < expt(2, p)}))
{2}   v'1 = v'2
```

Expanding the definition of choose,

Using lemma epsilon_ax,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `bits_equal3.1.1.1.1.2`.

`bits_equal3.1.1.1.1.3:`

```
{-1}  v'1 =
      rem(expt(2, choose({p: posnat | v'1 < expt(2, p) ∧ v'2 < expt(2, p)})))
        (v'2)
{-2}  ∃ (x: posnat): v'1 < expt(2, x) ∧ v'2 < expt(2, x)
{-3}  v'1 ≥ 0
{-4}  v'2 ≥ 0
{-5}  ∀ (n: nat): bit_set?(n, v'1) = bit_set?(n, v'2)
------------------------------------------------------------------------
{1}   nonempty?[posnat]({p: posnat | v'1 < expt(2, p) ∧ v'2 < expt(2, p)})
{2}   v'1 = v'2
```

Expanding the definition of nonempty?,

Expanding the definition of empty?,

Rewriting using forall_not, matching in *,

Expanding the definition of member,

which is trivially true.

This completes the proof of `bits_equal3.1.1.1.1.3`.

`bits_equal3.1.1.1.2:`

{-1} rem(expt(2, choose({p: posnat | $v_1' < \text{expt}(2, p) \wedge v_2' < \text{expt}(2, p)$})) ($v_1'$) = rem(expt(2, choose({$p$: posnat | $v_1' < \text{expt}(2, p) \wedge v_2' < \text{expt}(2, p)$})) ($v_2'$)

& \quad\ \text{ndiv}(v_1,\ \text{expt}(2,\ m)) = \text{ndiv}(v_2,\ \text{expt}(2,\ m))
\end{array}
$$

Repeatedly Skolemizing and flattening,
Using lemma bits_equal3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -5 with the terms: (n!1 + m!1),
Simplifying, rewriting, and recording with decision procedures,
Rewriting using bit_set_ndiv_expt2, matching in *,
Rewriting using bit_set_ndiv_expt2, matching in *,
This completes the proof of `bits_equal4`.
Q.E.D.

C.16.9 Bitops.clear_bit_TCC1

Terse proof for `clear_bit_TCC1`.
`clear_bit_TCC1`:

$$
\begin{array}{ll}
\{1\} & \forall\ (n\colon\ \text{nat},\ \text{val}\colon\ \text{nat})\colon\ \text{bit\_set?}(n,\ \text{val}) \supset \text{val} - \text{expt}(2,\ n) \geq 0
\end{array}
$$

Repeatedly Skolemizing and flattening,
Expanding the definition of bit_set?,
Expanding the definition of cut_bit,
Using lemma rem_def_pos,
Simplifying, rewriting, and recording with decision procedures,
Adding type constraints for ndiv(val!1, expt(2, n!1)),
Repeatedly Skolemizing and flattening,
Replacing using formula -4,
Replacing using formula -2,
Simplifying, rewriting, and recording with decision procedures,
Keeping (-3 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `clear_bit_TCC1`.
Q.E.D.

C.16.10 Bitops.change_bit_single_bit_op

Terse proof for `change_bit_single_bit_op`.
`change_bit_single_bit_op`:

```
{1}  ∀ (n, m, v: nat, c: ⌊nat → bool⌋):
       n ≠ m ⊃ bit_set?(n, v) = bit_set?(n, change_bit(v, c)(m))
```

Installing automatic rewrites from: change_bit set_bit clear_bit bit_set? cut_bit
Repeatedly Skolemizing and flattening,
Expanding the definition of change_bit,
Expanding the definition of clear_bit,
Expanding the definition of set_bit,
Simplifying, rewriting, and recording with decision procedures,
Case splitting on rem(2)(ndiv(v!1, expt(2, m!1))) = 1,
we get 2 subgoals:
`change_bit_single_bit_op.1`:

```

                       ENDIF,
                       expt(2, n')))
          = 1)
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `change_bit_single_bit_op.2.2`.
Q.E.D.

C.16.11 Bitops.change_bit_result

Terse proof for `change_bit_result`.
`change_bit_result`:

{1} $\forall$ (n, v: nat, c: $\lfloor$nat $\to$ bool$\rfloor$): bit_set?(n, change_bit(v, c)(n)) = $c(n)$

Repeatedly Skolemizing and flattening,
Trying repeated skolemization, instantiation, and if-lifting,
we get 2 subgoals:
`change_bit_result.1`:

{-1} $n' \geq 0$
{-2} $v' \geq 0$
{-3} rem(2)(ndiv(v', expt(2, n'))) = 1
{-4} rem(2)(ndiv($v' - $expt(2, n'), expt(2, n'))) = 1

{1} $c'(n')$

Using lemma ndiv_minus_2,
Rewriting using divides_reflexive, matching in *,
Rewriting using ndiv_self, matching in *,
Using lemma rem_add_one,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bit_result.1`.
`change_bit_result.2`:

{-1} $n' \geq 0$
{-2} $v' \geq 0$
{-3} $c'(n')$

{1} rem(2)(ndiv(v', expt(2, n'))) = 1
{2} rem(2)(ndiv(expt(2, n') + v', expt(2, n'))) = 1

Using lemma ndiv_plus_1,
Rewriting using divides_reflexive, matching in *,
Rewriting using ndiv_self, matching in *,
Using lemma rem_add_one,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bit_result.2`.
Q.E.D.

C.16.12 Bitops.change_bits_TCC1

Terse proof for `change_bits_TCC1`.
`change_bits_TCC1`:

{1} $\forall$ (n: nat): $\neg$ $n = 0 \supset n - 1 \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `change_bits_TCC1`.
Q.E.D.

C.16.13 Bitops.change_bits_TCC2

Terse proof for `change_bits_TCC2`.

`change_bits_TCC2:`

```
{1}  ∀ (n: nat): ¬ n = 0 ⊃ n − 1 < n
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `change_bits_TCC2`.
Q.E.D.

C.16.14 Bitops.change_bits_result

Terse proof for `change_bits_result`.

`change_bits_result:`

```
{1}  ∀ (m, n: nat, val: nat, c: [nat → bool]):
       m ≤ n ⊃ bit_set?(m, change_bits(val, c)(n)) = c(m)
```

Inducting on n on formula 1,
we get 2 subgoals:

`change_bits_result.1:`

```
{1}  ∀ (m, val: nat, c: [nat → bool]):
       m ≤ 0 ⊃ bit_set?(m, change_bits(val, c)(0)) = c(m)
```

Repeatedly Skolemizing and flattening,
Case splitting on m!1 = 0,
we get 2 subgoals:

`change_bits_result.1.1:`

```
{-1}  m′ = 0
{-2}  m′ ≥ 0
{-3}  val′ ≥ 0
{-4}  m′ ≤ 0
-------------------------------------------------
 {1}  bit_set?(m′, change_bits(val′, c′)(0)) = c′(m′)
```

Replacing using formula -1,
Expanding the definition of change_bits,
Using lemma change_bit_result,
This completes the proof of `change_bits_result.1.1`.

`change_bits_result.1.2:`

```
{-1}  m′ ≥ 0
{-2}  val′ ≥ 0
{-3}  m′ ≤ 0
-------------------------------------------------
 {1}  m′ = 0
 {2}  bit_set?(m′, change_bits(val′, c′)(0)) = c′(m′)
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bits_result.1.2`.

`change_bits_result.2:`

{1} ∀ j:
(∀ (m, val: nat, c: [nat → bool]):
$m \leq j \supset$ bit_set?(m, change_bits(val, c)(j)) = $c(m)$)
⊃
(∀ (m, val: nat, c: [nat → bool]):
$m \leq j+1 \supset$ bit_set?(m, change_bits(val, c)($j+1$)) = $c(m)$)

Repeatedly Skolemizing and flattening,
Expanding the definition of change_bits,
Case splitting on m!1 = j!1 + 1,
we get 2 subgoals:
`change_bits_result.2.1:`

{-1} $m' = j' + 1$
{-2} $m' \geq 0$
{-3} val$' \geq 0$
{-4} $j' \geq 0$
{-5} ∀ (m, val: nat, c: [nat → bool]):
$m \leq j' \supset$ bit_set?(m, change_bits(val, c)(j')) = $c(m)$
{-6} $m' \leq j' + 1$

{1} bit_set?(m', change_bit(change_bits(val$'$, c')(j'), c')($1 + j'$)) = $c'(m')$

Using lemma change_bit_result,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `change_bits_result.2.1`.
`change_bits_result.2.2:`

{-1} $m' \geq 0$
{-2} val$' \geq 0$
{-3} $j' \geq 0$
{-4} ∀ (m, val: nat, c: [nat → bool]):
$m \leq j' \supset$ bit_set?(m, change_bits(val, c)(j')) = $c(m)$
{-5} $m' \leq j' + 1$

{1} $m' = j' + 1$
{2} bit_set?(m', change_bit(change_bits(val$'$, c')(j'), c')($1 + j'$)) = $c'(m')$

Using lemma change_bit_single_bit_op,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `change_bits_result.2.2`.
Q.E.D.

C.16.15 Bitops.change_bits_unchanged

Terse proof for `change_bits_unchanged`.
`change_bits_unchanged:`

{1} ∀ (m, n: nat, val: nat, c: [nat → bool]):
$m > n \supset$ bit_set?(m, change_bits(val, c)(n)) = bit_set?(m, val)

Inducting on n on formula 1,
we get 2 subgoals:
`change_bits_unchanged.1`:

{1} ∀ (m, val: nat, c: [nat → bool]):
$m > 0$ ⊃ bit_set?(m, change_bits(val, c)(0)) = bit_set?(m, val)

Repeatedly Skolemizing and flattening,
Expanding the definition of change_bits,
Using lemma change_bit_single_bit_op,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bits_unchanged.1`.
`change_bits_unchanged.2`:

{1} ∀ j:
(∀ (m, val: nat, c: [nat → bool]):
$m > j$ ⊃ bit_set?(m, change_bits(val, c)(j)) = bit_set?(m, val))
⊃
(∀ (m, val: nat, c: [nat → bool]):
$m > j+1$ ⊃
bit_set?(m, change_bits(val, c)($j+1$)) = bit_set?(m, val))

Repeatedly Skolemizing and flattening,
Expanding the definition of change_bits,
Using lemma change_bit_single_bit_op,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bits_unchanged.2`.
Q.E.D.

C.16.16 Bitops.change_bits_below_TCC1

Terse proof for `change_bits_below_TCC1`.
`change_bits_below_TCC1`:

{1} ∀ (v: below[expt(2, p)]): $p - 1 \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `change_bits_below_TCC1`.
Q.E.D.

C.16.17 Bitops.change_bits_below

Terse proof for `change_bits_below`.
`change_bits_below`:

{1} ∀ (v: below[expt(2, p)], c: [nat → bool]):
change_bits(v, c)($p-1$) < expt(2, p)

Repeatedly Skolemizing and flattening,

Using lemma number_split,
we get 2 subgoals:
`change_bits_below.1:`

{-1} change_bits(v', c')($p-1$) =
  expt(2, p) × ndiv(change_bits(v', c')($p-1$), expt(2, p)) + rem(expt(2, p))(change_bits(v', c')($p-1$))
{-2} $v' <$ expt(2, p)

{1} change_bits(v', c')($p-1$) < expt(2, p)

Replacing using formula -1,
Hiding formulas: -1,
Using lemma bit_split_less,
we get 2 subgoals:
`change_bits_below.1.1:`

{-1} rem(expt(2, p))(change_bits(v', c')($p-1$)) < expt(2, p) ⊃
  (ndiv(change_bits(v', c')($p-1$), expt(2, p)) × expt(2, p) + rem(expt(2, p))(change_bits(v', c')($p-1$))
    < expt(2, $p+0$)
    ≡ ndiv(change_bits(v', c')($p-1$), expt(2, p)) < expt(2, 0))
{-2} $v' <$ expt(2, p)

{1} expt(2, p) × ndiv(change_bits(v', c')($p-1$), expt(2, p)) + rem(expt(2, p))(change_bits(v', c')($p-1$))
  < expt(2, p)

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: (1 3),
Applying change_bits_unchanged
Instantiating the top quantifier in -1 with the terms: (_ p - 1 v!1 c!1),
Using lemma bits_equal4,
Splitting conjunctions,
we get 2 subgoals:
`change_bits_below.1.1.1:`

{-1} ndiv(change_bits(v', c')($p-1$), expt(2, p)) = ndiv(v', expt(2, p))
{-2} ∀ (m: nat):
    $m > p-1$ ⊃
      bit_set?(m, change_bits(v', c')($p-1$)) = bit_set?(m, v')
{-3} $v' <$ expt(2, p)

{1} ndiv(change_bits(v', c')($p-1$), expt(2, p)) < expt(2, 0)

Replacing using formula -1,
Hiding formulas: (-1 -2),
Rewriting using ndiv_bigger, matching in *,
Expanding the definition of expt,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `change_bits_below.1.1.1`.
`change_bits_below.1.1.2:`

{-1} ∀ (m: nat):
    $m > p-1$ ⊃
      bit_set?(m, change_bits(v', c')($p-1$)) = bit_set?(m, v')
{-2} $v' <$ expt(2, p)

{1} ∀ (n: nat):
    $n \geq p$ ⊃ bit_set?(n, change_bits(v', c')($p-1$)) = bit_set?(n, v')
{2} ndiv(change_bits(v', c')($p-1$), expt(2, p)) < expt(2, 0)

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bits_below.1.1.2`.
`change_bits_below.1.2`:

{-1}	$v' < \text{expt}(2, p)$
{1}	$p - 1 \geq 0$
{2}	$\text{expt}(2, p) \times \text{ndiv}(\text{change\_bits}(v', c')(p-1), \text{expt}(2, p)) + \text{rem}(\text{expt}(2, p))(\text{change\_bits}(v', c')(p$ $< \text{expt}(2, p)$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bits_below.1.2`.
`change_bits_below.2`:

{-1}	$v' < \text{expt}(2, p)$
{1}	$p - 1 \geq 0$
{2}	$\text{change\_bits}(v', c')(p-1) < \text{expt}(2, p)$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `change_bits_below.2`.
Q.E.D.

C.16.18 Bitops.binary_not_TCC1

Terse proof for `binary_not_TCC1`.
`binary_not_TCC1`:

{1}	$\forall$ (val: $\text{below}\lfloor\text{expt}(2, p)\rfloor$): $\text{change\_bits}(\text{val}, \lambda\ (n: \text{nat}): \neg\ \text{bit\_set?}(n, \text{val}))(p-1) < \text{expt}(2, p)$

Repeatedly Skolemizing and flattening,
Rewriting using change_bits_below, matching in *,
This completes the proof of `binary_not_TCC1`.
Q.E.D.

C.16.19 Bitops.binary_not_not

Terse proof for `binary_not_not`.
`binary_not_not`:

{1}	$\forall$ (val: $\text{below}\lfloor\text{expt}(2, p)\rfloor$): $\text{binary\_not}(\text{binary\_not}(\text{val})) = \text{val}$

Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Expanding the definition of binary_not,
Using lemma change_bits_result,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Hiding formulas: -1,
Using lemma change_bits_result,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `binary_not_not`.
Q.E.D.

C.16.20 Bitops.binary_and_TCC1

Terse proof for `binary_and_TCC1`.
`binary_and_TCC1`:

{1} $\forall$ (v_1, v_2: below$\lfloor$expt(2, p)$\rfloor$):
change_bits(v_1, λ (n: nat): bit_set?(n, v_1) $\wedge$ bit_set?(n, v_2))($p-1$) $<$
expt(2, p)

Repeatedly Skolemizing and flattening,
Rewriting using change_bits_below, matching in *,
This completes the proof of `binary_and_TCC1`.
Q.E.D.

C.16.21 Bitops.binary_and_not

Terse proof for `binary_and_not`.
`binary_and_not`:

{1} $\forall$ (val: below$\lfloor$expt(2, p)$\rfloor$): binary_and(val, binary_not(val)) $=$ 0

Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Expanding the definition of binary_and,
Using lemma change_bits_result,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Hiding formulas: -1,
Expanding the definition of binary_not,
Using lemma change_bits_result,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Expanding the definition of bit_set?,
Using lemma cut_bit_zero,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_and_not`.
Q.E.D.

C.16.22 Bitops.binary_and_full_TCC1

Terse proof for `binary_and_full_TCC1`.
`binary_and_full_TCC1`:

{1} $\forall$ (val: below$\lfloor$expt(2, p)$\rfloor$):
expt(2, p) $-$ 1 $\geq$ 0 $\wedge$ expt(2, p) $-$ 1 $<$ expt(2, p)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_and_full_TCC1`.
Q.E.D.

C.16.23 Bitops.binary_and_full

Terse proof for `binary_and_full`.
`binary_and_full:`

```
{1}  ∀ (val: below⌊expt(2, p)⌋): binary_and(val, expt(2, p) − 1) = val
```

Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
we get 2 subgoals:
`binary_and_full.1:`

```
{-1}  (∀ (n: nat):
         n < p ⊃
           bit_set?(n, binary_and(val′, expt(2, p) − 1)) = bit_set?(n, val′))
       ≡ binary_and(val′, expt(2, p) − 1) = val′
{-2}  val′ < expt(2, p)
{1}   binary_and(val′, expt(2, p) − 1) = val′
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Hiding formulas: 2,
Expanding the definition of binary_and,
Using lemma change_bits_result,
we get 2 subgoals:
`binary_and_full.1.1:`

```
{-1}  n′ ≤ p − 1 ⊃
       bit_set?(n′,
                change_bits(val′,
                            λ (n: nat):
                              bit_set?(n, val′) ∧ bit_set?(n, expt(2, p) − 1))
                           (p − 1))
         = (bit_set?(n′, val′) ∧ bit_set?(n′, expt(2, p) − 1))
{-2}  n′ ≥ 0

{1}   bit_set?(n′,
               change_bits(val′,
                           λ (n: nat):
                             bit_set?(n, val′) ∧ bit_set?(n, expt(2, p) − 1))
                          (p − 1))
       = bit_set?(n′, val′)
```

Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,

Hiding formulas: -1,
Rewriting using bit_set_full_mask, matching in *,
This completes the proof of `binary_and_full.1.1`.
`binary_and_full.1.2:`

```
{-1}  n' >= 0
{-2}  n' < p
{-3}  val' < expt(2, p)
|-------
{1}   FORALL (n: nat): bit_set?(n, val') IMPLIES expt(2, p) - 1 >= 0
{2}   bit_set?(n',
                change_bits(val',
                            LAMBDA (n: nat):
                              bit_set?(n, val') AND bit_set?(n, expt(2, p) - 1))
                           (p - 1))
        = bit_set?(n', val')
```

Repeatedly Skolemizing and flattening,
Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_and_full.1.2`.
`binary_and_full.2:`

```
{-1}  val' < expt(2, p)
|-------
{1}   expt(2, p) - 1 >= 0
{2}   binary_and(val', expt(2, p) - 1) = val'
```

Expanding the definition of binary_and,
Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_and_full.2`.
Q.E.D.

C.16.24 Bitops.binary_and_zero_TCC1

Terse proof for `binary_and_zero_TCC1`.
`binary_and_zero_TCC1:`

```
|-------
{1}   FORALL (val: below(ceiling(expt(2, p)))): 0 < expt(2, p)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `binary_and_zero_TCC1`.
Q.E.D.

C.16.25 Bitops.binary_and_zero

Terse proof for `binary_and_zero`.
`binary_and_zero:`

```
|-------
{1}   FORALL (val: below(ceiling(expt(2, p)))): binary_and(val, 0) = 0
```

Repeatedly Skolemizing and flattening,

Using lemma bits_equal2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Hiding formulas: 2,
Expanding the definition of binary_and,
Rewriting using change_bits_result, matching in *,
Rewriting using bit_set_zero_mask, matching in *,
This completes the proof of `binary_and_zero`.
Q.E.D.

C.16.26 Bitops.binary_or_TCC1

Terse proof for `binary_or_TCC1`.
`binary_or_TCC1`:

$$\{1\}\quad \forall\ (v_1,\ v_2\colon \text{below}\lfloor \text{expt}(2,\ p)\rfloor)\colon \text{change\_bits}(v_1,\ \lambda\ (n\colon \text{nat})\colon \text{bit\_set?}(n,\ v_1)\ \vee\ \text{bit\_set?}(n,\ v_2))(p-1)\ <\ \text{expt}(2,\ p)$$

Repeatedly Skolemizing and flattening,
Rewriting using change_bits_below, matching in *,
This completes the proof of `binary_or_TCC1`.
Q.E.D.

C.16.27 Bitops.binary_or_not

Terse proof for `binary_or_not`.
`binary_or_not`:

$$\{1\}\quad \forall\ (\text{val}\colon \text{below}\lfloor \text{expt}(2,\ p)\rfloor)\colon \text{binary\_or}(\text{val},\ \text{binary\_not}(\text{val}))\ =\ \text{expt}(2,\ p)-1$$

Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
we get 2 subgoals:
`binary_or_not.1`:

$$\begin{array}{ll}\{-1\} & (\forall\ (n\colon \text{nat})\colon\ n\ <\ p\ \supset\ \text{bit\_set?}(n,\ \text{binary\_or}(\text{val}',\ \text{binary\_not}(\text{val}')))\ =\ \text{bit\_set?}(n,\ \text{expt}(2,\ p)-1))\\ & \equiv\ \text{binary\_or}(\text{val}',\ \text{binary\_not}(\text{val}'))\ =\ \text{expt}(2,\ p)-1\\ \{-2\} & \text{val}'\ <\ \text{expt}(2,\ p)\\ \hline \{1\} & \text{binary\_or}(\text{val}',\ \text{binary\_not}(\text{val}'))\ =\ \text{expt}(2,\ p)-1\end{array}$$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Expanding the definition of binary_or,
Rewriting using change_bits_result, matching in *,
Expanding the definition of binary_not,
Rewriting using change_bits_result, matching in *,
Rewriting using bit_set_full_mask, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `binary_or_not.1`.
`binary_or_not.2`:

```
{-1}  val′ < expt(2, p)
------------------------------------------------------------
{1}   expt(2, p) − 1 ≥ 0
{2}   binary_or(val′, binary_not(val′)) = expt(2, p) − 1
```

Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_or_not.2`.
Q.E.D.

C.16.28 Bitops.binary_xor_TCC1

Terse proof for `binary_xor_TCC1`.
`binary_xor_TCC1`:

```
------------------------------------------------------------
{1}   ∀ (v1, v2: below⌊expt(2, p)⌋):
        change_bits(v1, λ (n: nat): bit_set?(n, v1) ≠ bit_set?(n, v2))(p − 1) <
          expt(2, p)
```

Repeatedly Skolemizing and flattening,
Rewriting using change_bits_below, matching in *,
This completes the proof of `binary_xor_TCC1`.
Q.E.D.

C.16.29 Bitops.binary_xor_self

Terse proof for `binary_xor_self`.
`binary_xor_self`:

```
------------------------------------------------------------
{1}   ∀ (val: below⌊expt(2, p)⌋): binary_xor(val, val) = 0
```

Expanding the definition of binary_xor,
Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
we get 3 subgoals:
`binary_xor_self.1`:

```
{-1}  (∀ (n_1: nat):
         n_1 < p ⊃
           bit_set?(n_1, change_bits(val′, λ (n: nat): FALSE)(p − 1)) =
             bit_set?(n_1, 0))
        ≡ change_bits(val′, λ (n: nat): FALSE)(p − 1) = 0
{-2}  val′ < expt(2, p)
------------------------------------------------------------
{1}   change_bits(val′, λ (n: nat): FALSE)(p − 1) = 0
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Rewriting using bit_set_zero_mask, matching in *,
Rewriting using change_bits_result, matching in *,
This completes the proof of `binary_xor_self.1`.

`binary_xor_self.2`:

$$\begin{array}{ll}\{\text{-1}\} & \text{val}' < \text{expt}(2,\ p)\\ \hline \{1\} & \text{change\_bits}(\text{val}',\ \lambda\ (n\colon \text{nat})\colon \text{FALSE})(p-1) < \text{expt}(2,\ p)\\ \{2\} & \text{change\_bits}(\text{val}',\ \lambda\ (n\colon \text{nat})\colon \text{FALSE})(p-1) = 0\end{array}$$

Using lemma change_bits_below,
This completes the proof of `binary_xor_self.2`.
`binary_xor_self.3`:

$$\begin{array}{ll}\{\text{-1}\} & \text{val}' < \text{expt}(2,\ p)\\ \hline \{1\} & p-1 \geq 0\\ \{2\} & \text{change\_bits}(\text{val}',\ \lambda\ (n\colon \text{nat})\colon \text{FALSE})(p-1) = 0\end{array}$$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_xor_self.3`.
Q.E.D.

C.16.30 Bitops.binary_or_full

Terse proof for `binary_or_full`.
`binary_or_full`:

$$\begin{array}{ll}\{1\} & \forall\ (\text{val}\colon \text{below}\lfloor\text{expt}(2,\ p)\rfloor)\colon\\ & \quad \text{binary\_or}(\text{val},\ \text{expt}(2,\ p)-1) = \text{expt}(2,\ p)-1\end{array}$$

Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
we get 2 subgoals:
`binary_or_full.1`:

$$\begin{array}{ll}\{\text{-1}\} & (\forall\ (n\colon \text{nat})\colon\\ & \quad n < p \supset\\ & \quad\ \text{bit\_set?}(n,\ \text{binary\_or}(\text{val}',\ \text{expt}(2,\ p)-1)) =\\ & \quad\ \text{bit\_set?}(n,\ \text{expt}(2,\ p)-1))\\ & \equiv \text{binary\_or}(\text{val}',\ \text{expt}(2,\ p)-1) = \text{expt}(2,\ p)-1\\ \{\text{-2}\} & \text{val}' < \text{expt}(2,\ p)\\ \hline \{1\} & \text{binary\_or}(\text{val}',\ \text{expt}(2,\ p)-1) = \text{expt}(2,\ p)-1\end{array}$$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Expanding the definition of binary_or,
Hiding formulas: 2,
Rewriting using change_bits_result, matching in *,
we get 2 subgoals:
`binary_or_full.1.1`:

$$\begin{array}{ll}\{\text{-1}\} & n' \geq 0\\ \{\text{-2}\} & n' < p\\ \{\text{-3}\} & \text{val}' < \text{expt}(2,\ p)\\ \hline \{1\} & (\text{bit\_set?}(n',\ \text{val}') \vee \text{bit\_set?}(n',\ \text{expt}(2,\ p)-1)) =\\ & \quad \text{bit\_set?}(n',\ \text{expt}(2,\ p)-1)\end{array}$$

Rewriting using bit_set_full_mask, matching in *,
This completes the proof of `binary_or_full.1.1`.

`binary_or_full.1.2:`

$$
\begin{array}{ll}
\{\text{-1}\} & n' \geq 0 \\
\{\text{-2}\} & n' < p \\
\{\text{-3}\} & \text{val}' < \text{expt}(2,\ p) \\
\hline
\{1\} & \forall\ (n\colon \text{nat})\colon \neg\ \text{bit\_set?}(n,\ \text{val}') \supset \text{expt}(2,\ p) - 1 \geq 0 \\
\{2\} & \text{bit\_set?}(n', \\
 & \qquad \text{change\_bits}(\text{val}', \\
 & \qquad\qquad \lambda\ (n\colon \text{nat})\colon \\
 & \qquad\qquad\quad \text{bit\_set?}(n,\ \text{val}')\ \vee\ \text{bit\_set?}(n,\ \text{expt}(2,\ p) - 1)) \\
 & \qquad\qquad (p - 1)) \\
 & \quad = \text{bit\_set?}(n',\ \text{expt}(2,\ p) - 1)
\end{array}
$$

Repeatedly Skolemizing and flattening,
Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_or_full.1.2`.
`binary_or_full.2:`

$$
\begin{array}{ll}
\{\text{-1}\} & \text{val}' < \text{expt}(2,\ p) \\
\hline
\{1\} & \text{expt}(2,\ p) - 1 \geq 0 \\
\{2\} & \text{binary\_or}(\text{val}',\ \text{expt}(2,\ p) - 1) = \text{expt}(2,\ p) - 1
\end{array}
$$

Expanding the definition of binary_or,
Using lemma expt_ge1,
Expanding the definition of ^,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `binary_or_full.2`.
Q.E.D.

C.16.31 Bitops.binary_or_zero

Terse proof for `binary_or_zero`.
`binary_or_zero:`

$$
\begin{array}{ll}
 & \\
\hline
\{1\} & \forall\ (\text{val}\colon \text{below}\lfloor \text{expt}(2,\ p)\rfloor)\colon \text{binary\_or}(\text{val},\ 0) = \text{val}
\end{array}
$$

Repeatedly Skolemizing and flattening,
Using lemma bits_equal2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Repeatedly Skolemizing and flattening,
Expanding the definition of binary_or,
Rewriting using change_bits_result, matching in *,
Rewriting using bit_set_zero_mask, matching in *,
This completes the proof of `binary_or_zero`.
Q.E.D.

C.17 Proofs for Bits (bits.pvs)

C.17.1 Bits.bool_to_nat_below

Terse proof for `bool_to_nat_below`.

`bool_to_nat_below`:

$$\{1\} \quad \forall\ (b\colon \text{bool})\colon \text{bool\_to\_nat}(b) < 2$$

Repeatedly Skolemizing and flattening,
Expanding the definition of bool_to_nat,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bool_to_nat_below`.
Q.E.D.

C.17.2 Bits.nat_bool_iso

Terse proof for `nat_bool_iso`.
`nat_bool_iso`:

$$\{1\} \quad \forall\ (b\colon \text{bool})\colon \text{nat\_to\_bool}(\text{bool\_to\_nat}(b)) = b$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `nat_bool_iso`.
Q.E.D.

C.17.3 Bits.cut_bit_zero

Terse proof for `cut_bit_zero`.
`cut_bit_zero`:

$$\{1\} \quad \forall\ (i\colon \text{nat})\colon \text{cut\_bit}(0,\ i) = \text{FALSE}$$

Repeatedly Skolemizing and flattening,
Expanding the definition of cut_bit,
Rewriting using ndiv_0, matching in *,
Rewriting using rem_zero, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `cut_bit_zero`.
Q.E.D.

C.17.4 Bits.cut_bits_below

Terse proof for `cut_bits_below`.
`cut_bits_below`:

$$\{1\} \quad \forall\ (i,\ k,\ n\colon \text{nat})\colon \text{cut\_bits}(n,\ i,\ k) < \text{expt}(2,\ k)$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cut_bits_below`.
Q.E.D.

C.17.5 Bits.cut_bits_aligned

Terse proof for `cut_bits_aligned`.

`cut_bits_aligned`:

{1} $\forall$ (n, i, k: nat): $i \leq k \wedge \text{cut\_bits}(n, 0, k) = 0 \supset \text{aligned?}(i)(n)$

Repeatedly Skolemizing and flattening,
Expanding the definition of cut_bits,
Expanding the definition of expt,
Rewriting using ndiv_1, matching in *,
Expanding the definition of aligned?,
Rewriting using rem_def2, matching in *,
Applying divides_expt_gt
Instantiating the top quantifier in -1 with the terms: n', k', i',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `cut_bits_aligned`.
Q.E.D.

C.17.6 Bits.aligned_cut_bits

Terse proof for `aligned_cut_bits`.
`aligned_cut_bits`:

{1} $\forall$ (n, i, j: nat, k: nat):
$i + j \leq k \wedge \text{aligned?}(k)(n) \supset \text{cut\_bits}(n, i, j) = 0$

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Expanding the definition of cut_bits,
Rewriting using rem_ndiv, matching in *,
Rewriting using expt_plus_aux, matching in *,
Applying rem_def2
Instantiating the top quantifier in -1 with the terms: expt(2, $i' + j'$), n', 0,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Using lemma divides_expt_gt,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_cut_bits`.
Q.E.D.

C.17.7 Bits.aligned_add_cut_bits

Terse proof for `aligned_add_cut_bits`.
`aligned_add_cut_bits`:

{1} $\forall$ (n, m, i, j, k: nat):
$i + j \leq k \wedge \text{aligned?}(k)(n) \supset$
$\text{cut\_bits}(n + m, i, j) = \text{cut\_bits}(m, i, j)$

Repeatedly Skolemizing and flattening,
Applying aligned_cut_bits
Instantiating the top quantifier in -1 with the terms: (n!1 i!1 j!1 k!1),
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of cut_bits,
Using lemma ndiv_plus_2,

Splitting conjunctions,
we get 2 subgoals:
`aligned_add_cut_bits.1:`

{-1} $\text{ndiv}(m' + n',\ \text{expt}(2,\ i')) =$
$\text{ndiv}(m',\ \text{expt}(2,\ i')) + \text{ndiv}(n',\ \text{expt}(2,\ i'))$
{-2} $\text{rem}(\text{expt}(2,\ j'))(\text{ndiv}(n',\ \text{expt}(2,\ i'))) = 0$
{-3} $n' \geq 0$
{-4} $m' \geq 0$
{-5} $i' \geq 0$
{-6} $j' \geq 0$
{-7} $k' \geq 0$
{-8} $i' + j' \leq k'$
{-9} $\text{aligned?}(k')(n')$

{1} $\text{rem}(\text{expt}(2,\ j'))(\text{ndiv}(m' + n',\ \text{expt}(2,\ i'))) =$
$\text{rem}(\text{expt}(2,\ j'))(\text{ndiv}(m',\ \text{expt}(2,\ i')))$

Replacing using formula -1,
Rewriting using rem_sum2, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_add_cut_bits.1`.
`aligned_add_cut_bits.2:`

{-1} $\text{rem}(\text{expt}(2,\ j'))(\text{ndiv}(n',\ \text{expt}(2,\ i'))) = 0$
{-2} $n' \geq 0$
{-3} $m' \geq 0$
{-4} $i' \geq 0$
{-5} $j' \geq 0$
{-6} $k' \geq 0$
{-7} $i' + j' \leq k'$
{-8} $\text{aligned?}(k')(n')$

{1} $\text{divides}(\text{expt}(2,\ i'),\ n')$
{2} $\text{rem}(\text{expt}(2,\ j'))(\text{ndiv}(m' + n',\ \text{expt}(2,\ i'))) =$
$\text{rem}(\text{expt}(2,\ j'))(\text{ndiv}(m',\ \text{expt}(2,\ i')))$

Hiding formulas: 2,
Expanding the definition of aligned?,
Rewriting using divides_transitive, matching in * where n gets expt(2, i!1), m gets expt(2, k!1), l gets n!1,
Hiding formulas: 2,
Expanding the definition of divides,
Instantiating the top quantifier in 1 with the terms: $\text{expt}(2, k' - i')$,
Keeping 1 and hiding *,
Rewriting using expt_plus_aux, matching in *,
This completes the proof of `aligned_add_cut_bits.2`.
Q.E.D.

C.17.8 Bits.cut_bit_bits

Terse proof for `cut_bit_bits`.
`cut_bit_bits:`

{1} $\forall\ (i,\ n\text{: nat})\text{: cut\_bit}(n,\ i) = \text{IF cut\_bits}(n,\ i,\ 1) = 1\ \text{THEN TRUE ELSE FALSE ENDIF}$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cut_bit_bits`.
Q.E.D.

C.17.9 Bits.cut_bits_zero

Terse proof for `cut_bits_zero`.
`cut_bits_zero:`

{1} $\forall$ (i, k: nat): cut_bits(0, i, k) = 0

Repeatedly Skolemizing and flattening,
Expanding the definition of cut_bits,
Installing automatic rewrites from: ndiv_0 rem_zero
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `cut_bits_zero`.
Q.E.D.

C.17.10 Bits.zero_cut_bits

Terse proof for `zero_cut_bits`.
`zero_cut_bits:`

{1} $\forall$ (n, i, k: nat): $k = 0 \supset$ cut_bits(n, i, k) = 0

Repeatedly Skolemizing and flattening,
Replacing using formula -4,
Expanding the definition of cut_bits,
Rewriting using expt_x0_aux, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `zero_cut_bits`.
Q.E.D.

C.17.11 Bits.cut_bits_cut_bits_TCC1

Terse proof for `cut_bits_cut_bits_TCC1`.
`cut_bits_cut_bits_TCC1:`

{1} $\forall$ (k_1, i_2, k_2: nat): $i_2 + k_2 > k_1 \wedge \neg\ i_2 \geq k_1 \supset k_1 - i_2 \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cut_bits_cut_bits_TCC1`.
Q.E.D.

C.17.12 Bits.cut_bits_cut_bits

Terse proof for `cut_bits_cut_bits`.

`cut_bits_cut_bits:`

{1} $\forall\ (n,\ i_1,\ k_1,\ i_2,\ k_2\colon \text{nat})\colon$
cut_bits(cut_bits($n,\ i_1,\ k_1$), $i_2,\ k_2$) =
IF $i_2 \geq k_1$
THEN 0
ELSIF $i_2 + k_2 > k_1$ THEN cut_bits($n,\ i_1 + i_2,\ k_1 - i_2$)
ELSE cut_bits($n,\ i_1 + i_2,\ k_2$)
ENDIF

Repeatedly Skolemizing and flattening,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 3 subgoals:

`cut_bits_cut_bits.1:`

{-1} $n' \geq 0$
{-2} $i'_1 \geq 0$
{-3} $k'_1 \geq 0$
{-4} $i'_2 \geq 0$
{-5} $k'_2 \geq 0$
{-6} $i'_2 \geq k'_1$

{1} cut_bits(cut_bits($n',\ i'_1,\ k'_1$), $i'_2,\ k'_2$) = 0

Expanding the definition of cut_bits,

Applying ndiv_plus_mod

Installing automatic rewrites from: divides_zero ndiv_0 rem_zero

Instantiating the top quantifier in -1 with the terms: 0, expt(2, i'_2), rem(expt(2, k'_1))(ndiv(n', expt(2, i'_1))),

we get 2 subgoals:

`cut_bits_cut_bits.1.1:`

{-1} divides(expt(2, i'_2), 0) $\supset$
ndiv(0 + rem(expt(2, k'_1))(ndiv(n', expt(2, i'_1))), expt(2, i'_2)) =
ndiv(0, expt(2, i'_2))
{-2} $n' \geq 0$
{-3} $i'_1 \geq 0$
{-4} $k'_1 \geq 0$
{-5} $i'_2 \geq 0$
{-6} $k'_2 \geq 0$
{-7} $i'_2 \geq k'_1$

{1} rem(expt(2, k'_2))
(ndiv(rem(expt(2, k'_1))(ndiv(n', expt(2, i'_1))), expt(2, i'_2)))
= 0

Simplifying, rewriting, and recording with decision procedures,

Replacing using formula -1,

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `cut_bits_cut_bits.1.1`.

`cut_bits_cut_bits.1.2:`

{-1} $n' \geq 0$
{-2} $i'_1 \geq 0$
{-3} $k'_1 \geq 0$
{-4} $i'_2 \geq 0$
{-5} $k'_2 \geq 0$
{-6} $i'_2 \geq k'_1$

{1} $\text{rem}(\text{expt}(2, k'_1))(\text{ndiv}(n', \text{expt}(2, i'_1))) < \text{expt}(2, i'_2)$
{2} $\text{rem}(\text{expt}(2, k'_2))$
$\quad(\text{ndiv}(\text{rem}(\text{expt}(2, k'_1))(\text{ndiv}(n', \text{expt}(2, i'_1))), \text{expt}(2, i'_2)))$
$\quad= 0$

Applying both_sides_expt_gt1_le
Instantiating the top quantifier in -1 with the terms: 2, k'_1, i'_2,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `cut_bits_cut_bits.1.2`.
`cut_bits_cut_bits.2:`

{-1} $n' \geq 0$
{-2} $i'_1 \geq 0$
{-3} $k'_1 \geq 0$
{-4} $i'_2 \geq 0$
{-5} $k'_2 \geq 0$
{-6} $i'_2 + k'_2 > k'_1$

{1} $i'_2 \geq k'_1$
{2} $\text{cut\_bits}(\text{cut\_bits}(n', i'_1, k'_1), i'_2, k'_2) =$
$\quad\text{cut\_bits}(n', i'_1 + i'_2, k'_1 - i'_2)$

Installing automatic rewrites from: cut_bits rem_ndiv expt_plus
Simplifying, rewriting, and recording with decision procedures,
Rewriting using ndiv_times_2, matching in *,
Applying rem_mod
Instantiating the top quantifier in -1 with the terms: $\text{expt}(2, i'_1 + i'_2 + k'_2)$, $\text{rem}(\text{expt}(2, i'_1 + k'_1))(n')$,
we get 2 subgoals:
`cut_bits_cut_bits.2.1:`

{-1} $\text{rem}(\text{expt}(2, i'_1 + i'_2 + k'_2))(\text{rem}(\text{expt}(2, i'_1 + k'_1))(n')) =$
$\quad\text{rem}(\text{expt}(2, i'_1 + k'_1))(n')$
{-2} $n' \geq 0$
{-3} $i'_1 \geq 0$

{1} $k' - i' \geq 0$
{2} $n' \times \text{expt}(2,\ i') < \text{expt}(2,\ k')$

Simplifying, rewriting, and recording with decision procedures,

This completes the proof of `shift_bits_left_less.2`.
Q.E.D.

C.17.16 Bits.aligned_shift_bits_ok

Terse proof for `aligned_shift_bits_ok`.
`aligned_shift_bits_ok`:

{1} $\forall\ (n,\ i,\ j\colon \text{nat})\colon\ i \leq j \supset \text{aligned?}(i)(\text{shift\_bits\_left}(n,\ j))$

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Expanding the definition of shift_bits_left,
Rewriting using divides_prod2, matching in *,
Rewriting using expt_divides, matching in *,
This completes the proof of `aligned_shift_bits_ok`.
Q.E.D.

C.17.17 Bits.aligned_shift_bits_reduce_TCC1

Terse proof for `aligned_shift_bits_reduce_TCC1`.
`aligned_shift_bits_reduce_TCC1`:

{1} $\forall\ (i,\ j\colon \text{nat})\colon\ i > j \supset i - j \geq 0$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `aligned_shift_bits_reduce_TCC1`.
Q.E.D.

C.17.18 Bits.aligned_shift_bits_reduce

Terse proof for `aligned_shift_bits_reduce`.
`aligned_shift_bits_reduce`:

{1} $\forall\ (n,\ i,\ j\colon \text{nat})\colon$ $\quad i > j \wedge \text{aligned?}(i-j)(n) \supset \text{aligned?}(i)(\text{shift\_bits\_left}(n,\ j))$

Repeatedly Skolemizing and flattening,
Expanding the definition of aligned?,
Expanding the definition of shift_bits_left,
Applying expt_plus
Instantiating the top quantifier in -1 with the terms: 2, $i' - j'$, j',
we get 2 subgoals:
`aligned_shift_bits_reduce.1`:

{-1} $\text{expt}(2,\ i' - j') \times \text{expt}(2,\ j') = \text{expt}(2,\ i' - j' + j')$
{-2} $n' \geq 0$
{-3} $i' \geq 0$
{-4} $j' \geq 0$
{-5} $i' > j'$
{-6} $\text{divides}(\text{expt}(2,\ i' - j'),\ n')$
{1} $\text{divides}(\text{expt}(2,\ i'),\ n' \times \text{expt}(2,\ j'))$

Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Using lemma divides_prod_elim2,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_shift_bits_reduce.1`.
`aligned_shift_bits_reduce.2`:

{-1} $n' \geq 0$
{-2} $i' \geq 0$
{-3} $j' \geq 0$
{-4} $i' > j'$
{-5} divides(expt(2, $i' - j'$), n')

{1} $i' - j' \geq 0$
{2} divides(expt(2, i'), $n' \times$ expt(2, j'))

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `aligned_shift_bits_reduce.2`.
Q.E.D.

C.17.19 Bits.overwrite_bits_TCC1

Terse proof for `overwrite_bits_TCC1`.
`overwrite_bits_TCC1`:

{1} $\forall$ (n, m, i, k: nat):
$n -$ rem(expt(2, $i + k$))(n) + shift_bits_left(cut_bits(m, i, k), i) + rem(expt(2, i))(n)
≥ 0

Repeatedly Skolemizing and flattening,
Using lemma rem_def_pos,
Simplifying, rewriting, and recording with decision procedures,
Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `overwrite_bits_TCC1`.
Q.E.D.

C.17.20 Bits.overwrite_bits_less

Terse proof for `overwrite_bits_less`.
`overwrite_bits_less`:

{1} $\forall$ (n, m, i, k, j: nat):
$n <$ expt(2, j) $\wedge$ $i + k \leq j \supset$ overwrite_bits(n, m, i, k) $<$ expt(2, j)

Repeatedly Skolemizing and flattening,
Expanding the definition of overwrite_bits,
Using lemma rem_def_pos,
Simplifying, rewriting, and recording with decision procedures,
Repeatedly Skolemizing and flattening,
Applying bit_split_less
Instantiating the top quantifier in -1 with the terms: q', rem(expt(2, i'))(n') + shift_bits_left(cut_bits(m', i', k'), i'), $j' - i' - k'$, $i' + k'$,
Simplifying, rewriting, and recording with decision procedures,

Splitting conjunctions,
we get 2 subgoals:
`overwrite_bits_less.1:`

{-1} $q' \geq 0$
{-2} $n' = \text{rem}(\text{expt}(2,\ i' + k'))(n') + \text{expt}(2,\ i' + k') \times q'$
{-3} $n' \geq 0$
{-4} $m' \geq 0$
{-5} $i' \geq 0$
{-6} $k' \geq 0$
{-7} $j' \geq 0$
{-8} $n' < \text{expt}(2,\ j')$
{-9} $i' + k' \leq j'$

{1} $q' < \text{expt}(2,\ -1 \times i' - k' + j')$
{2} $\text{rem}(\text{expt}(2,\ i'))(n') + \text{shift\_bits\_left}(\text{cut\_bits}(m',\ i',\ k'),\ i') - \text{rem}(\text{expt}(2,\ i' + k'))(n') + n' < \text{expt}(2,\ j')$

Hiding formulas: 2,
Applying both_sides_times_pos_ge2
Instantiating the top quantifier in -1 with the terms: expt(2, $i' + k'$), q', expt(2, $-1 \times i' - k' + j'$),
Rewriting using expt_plus, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `overwrite_bits_less.1`.
`overwrite_bits_less.2:`

{-1} $q' \geq 0$
{-2} $n' = \text{rem}(\text{expt}(2,\ i' + k'))(n') + \text{expt}(2,\ i' + k') \times q'$
{-3} $n' \geq 0$

{-8} $n' < \text{expt}(2,\ j')$
{-9} $i' + k' \leq j'$

{1} $\text{rem}(\text{expt}(2,\ i'))(n') + \text{shift\_bits\_left}(\text{cut\_bits}(m',\ i',\ k'),\ i') < \text{expt}(2,\ i' + k')$
{2} $\text{rem}(\text{expt}(2,\ i'))(n') + \text{shift\_bits\_left}(\text{cut\_bits}(m',\ i',\ k'),\ i') - \text{rem}(\text{expt}(2,\ i' + k'))(n') + n' < \text{expt}(2,\ j')$

Hiding formulas: 2,
Expanding the definition of shift_bits_left,
Applying bit_split_less
Instantiating the top quantifier in -1 with the terms: cut_bits(m', i', k'), rem(expt(2, i'))(n'), k', i',
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `overwrite_bits_less.2`.
Q.E.D.

C.17.21 Bits.overwrite_bit_less

Terse proof for `overwrite_bit_less`.
`overwrite_bit_less:`

{1} $\forall\ (n,\ m,\ i,\ k\text{: nat}):$
$n < \text{expt}(2,\ k) \wedge i < k \supset \text{overwrite\_bit}(n,\ m,\ i) < \text{expt}(2,\ k)$

Repeatedly Skolemizing and flattening,
Expanding the definition of overwrite_bit,
Rewriting using overwrite_bits_less, matching in *,
This completes the proof of `overwrite_bit_less`.
Q.E.D.

C.17.22 Bits.overwrite_bool_bit_less

Terse proof for `overwrite_bool_bit_less`.
`overwrite_bool_bit_less:`

{1} $\forall$ (n: nat, b: bool, i, k: nat):
$n < \text{expt}(2, k) \wedge i < k \supset \text{overwrite\_bool\_bit}(n, b, i) < \text{expt}(2, k)$

Repeatedly Skolemizing and flattening,
Expanding the definition of overwrite_bool_bit,
Rewriting using overwrite_bit_less, matching in *,
This completes the proof of `overwrite_bool_bit_less`.
Q.E.D.

C.17.23 Bits.overwrite_shift_bits_less

Terse proof for `overwrite_shift_bits_less`.
`overwrite_shift_bits_less:`

{1} $\forall$ (n, m, i, k, j: nat):
$n < \text{expt}(2, j) \wedge i + k \leq j \supset$
$\text{overwrite\_shift\_bits}(n, m, i, k) < \text{expt}(2, j)$

Repeatedly Skolemizing and flattening,
Expanding the definition of overwrite_shift_bits,
Rewriting using overwrite_bits_less, matching in *,
This completes the proof of `overwrite_shift_bits_less`.
Q.E.D.

C.17.24 Bits.aligned_overwrite_shift_bits_more

Terse proof for `aligned_overwrite_shift_bits_more`.
`aligned_overwrite_shift_bits_more:`

{1} $\forall$ (a, n, m, i: nat, k: posnat):
$a \leq i \wedge \text{aligned?}(a)(n) \supset \text{aligned?}(a)(\text{overwrite\_shift\_bits}(n, m, i, k))$

Repeatedly Skolemizing and flattening,
Expanding the definition of overwrite_shift_bits,
Expanding the definition of overwrite_bits,
Applying aligned_plus_n
Instantiating the top quantifier in -1 with the terms: a', $n' - \text{rem}(\text{expt}(2, i' + k'))(n')$, $\text{rem}(\text{expt}(2, i'))(n') + \text{shift\_bits\_left}(\text{cut\_bits}(\text{shift\_bits\_left}(m', i'), i', k'), i')$,
we get 3 subgoals:

`aligned_overwrite_shift_bits_more.1:`

{-1}	aligned?(a') (n' − rem(expt(2, $i' + k'$))(n') + rem(expt(2, i'))(n') + shift_bits_left(cut_bits(shift_bits_

Q.E.D.

C.18 Proofs for BitwiseExpressions (expressions.pvs)

This theory contains no provable formal statements.

C.19 Proofs for Block_Disjoint_Rewrites (plain_memory_rewrites.pvs)

C.19.1 Block_Disjoint_Rewrites.different_registers_blocks_disjoint

Terse proof for `different_registers_blocks_disjoint`.

`different_registers_blocks_disjoint:`

```
{1}  ∀ (addr1, addr2: Address, sz1, sz2: nat):
       type_of(addr1) ≠ type_of(addr2) ⊃ blocks_disjoint?(addr1, sz1, addr2, sz2)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `different_registers_blocks_disjoint`.
Q.E.D.

C.20 Proofs for BooleanConversions (conversions.pvs)

C.20.1 BooleanConversions.pointer_to_bool_TCC1

Terse proof for `pointer_to_bool_TCC1`.

`pointer_to_bool_TCC1:`

```
{1}  ∀ (p_typ: Cpp_Subtype(cv(pointer?))): pointer?(cv_base(p_typ))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pointer_to_bool_TCC1`.
Q.E.D.

C.21 Proofs for CatchAux (statements.pvs)

This theory contains no provable formal statements.

C.22 Proofs for Challenge_Device_Memory (device_memory.pvs)

C.22.1 Challenge_Device_Memory.pm_dev_plain

Terse proof for `pm_dev_plain`.

pm_dev_plain:

```
{1}  ∀ (device_read_side_effect,
            device_write_side_effect:
              [[Address, list[Byte], bool] →
                   [Device_memory[Physical_memory, pm_phy, Device_state] →
                        ExprResult[Device_memory, list[Byte]]]],
            pm: Plain_Memory[Device_memory]):
       is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
        plain_memory?(pm_phy)
```

Expanding the definition of is_device_plain_memory?,
Repeatedly Skolemizing and flattening,
This completes the proof of pm_dev_plain.
Q.E.D.

C.22.2 Challenge_Device_Memory.pm_dev_states

Terse proof for pm_dev_states.
pm_dev_states:

```
{1}  ∀ (device_read_side_effect,
            device_write_side_effect:
              [[Address, list[Byte], bool] →
                   [Device_memory[Physical_memory, pm_phy, Device_state] →
                        ExprResult[Device_memory, list[Byte]]]],
            pm: Plain_Memory[Device_memory]):
       is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
        pm‘states = em_lift(pm_phy‘states)
```

Expanding the definition of is_device_plain_memory?,
Repeatedly Skolemizing and flattening,
This completes the proof of pm_dev_states.
Q.E.D.

C.22.3 Challenge_Device_Memory.pm_dev_read

Terse proof for pm_dev_read.
pm_dev_read:

```
{1}  ∀ (device_read_side_effect,
            device_write_side_effect:
              [[Address, list[Byte], bool] →
                   [Device_memory[Physical_memory, pm_phy, Device_state] →
                        ExprResult[Device_memory, list[Byte]]]],
            pm: Plain_Memory[Device_memory]):
       is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
        memory_read(pm‘mem) =
         (λ (a: Address):
              em_lift[Physical_memory, Device_state, Byte](memory_read(pm_phy‘mem)(a)))
```

Expanding the definition of is_device_plain_memory?,
Expanding the definition of device_pm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_dev_read`.
Q.E.D.

C.22.4 Challenge_Device_Memory.pm_dev_write

Terse proof for `pm_dev_write`.

`pm_dev_write`:

```
{1}   ∀ (device_read_side_effect,
           device_write_side_effect:
             [[Address, list[Byte], bool] →
                [Device_memory[Physical_memory, pm_phy, Device_state] →
                   ExprResult[Device_memory, list[Byte]]]],
           pm: Plain_Memory[Device_memory]):
        is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
         memory_write(pm`mem) =
          (λ (a: Address, b: Byte):
             em_lift[Physical_memory, Device_state, Unit](memory_write(pm_phy`mem)(a, b)))
```

Expanding the definition of is_device_plain_memory?,
Repeatedly Skolemizing and flattening,
Expanding the definition of device_pm,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pm_dev_write`.
Q.E.D.

C.22.5 Challenge_Device_Memory.pm_dev_read_side_effect

Terse proof for `pm_dev_read_side_effect`.

`pm_dev_read_side_effect`:

```
{1}   ∀ (device_read_side_effect,
           device_write_side_effect:
             [[Address, list[Byte], bool] →
                [Device_memory[Physical_memory, pm_phy, Device_state] →
                   ExprResult[Device_memory, list[Byte]]]],
           pm: Plain_Memory[Device_memory]):
        is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
         memory_read_side_effect(pm`mem) =
          (λ (a: Address, bl: list[Byte], cp: bool):
             em_lift[Physical_memory, Device_state, list[Byte]]
               (memory_read_side_effect(pm_phy`mem)(a, bl, cp))
               ## (λ (bl1: list[Byte]): device_read_side_effect(a, bl1, cp)))
```

Expanding the definition of is_device_plain_memory?,

Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Expanding the definition of device_pm,
which is trivially true.
This completes the proof of `pm_dev_read_side_effect`.
Q.E.D.

C.22.6 Challenge_Device_Memory.pm_dev_write_side_effect

Terse proof for `pm_dev_write_side_effect`.
`pm_dev_write_side_effect:`

```
{1}  ∀ (device_read_side_effect,
          device_write_side_effect:
            [[Address, list[Byte], bool] →
                [Device_memory[Physical_memory, pm_phy, Device_state] →
                    ExprResult[Device_memory, list[Byte]]]],
          pm: Plain_Memory[Device_memory]):
        is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
         memory_write_side_effect(pm‘mem) =
          (λ (a: Address, bl: list[Byte], cp: bool):
              em_lift[Physical_memory, Device_state, list[Byte]]
                (memory_write_side_effect(pm_phy‘mem)(a, bl, cp))
                ## (λ (bl1: list[Byte]): device_write_side_effect(a, bl1, cp)))
```

Expanding the definition of is_device_plain_memory?,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Expanding the definition of device_pm,
which is trivially true.
This completes the proof of `pm_dev_write_side_effect`.
Q.E.D.

C.22.7 Challenge_Device_Memory.pm_dev_ro_rw_addr

Terse proof for `pm_dev_ro_rw_addr`.
`pm_dev_ro_rw_addr:`

```
{1}  ∀ (device_read_side_effect,
          device_write_side_effect:
            [[Address, list[Byte], bool] →
                [Device_memory[Physical_memory, pm_phy, Device_state] →
                    ExprResult[Device_memory, list[Byte]]]],
          pm: Plain_Memory[Device_memory]):
        is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
         ((pm‘ro_addr ∪ pm‘rw_addr) ⊆ (pm_phy‘ro_addr ∪ pm_phy‘rw_addr))
```

Expanding the definition of is_device_plain_memory?,
Repeatedly Skolemizing and flattening,
Keeping (-5 -6 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `pm_dev_ro_rw_addr`.
Q.E.D.

C.22.8 Challenge_Device_Memory.device_plain_transformers_ok

Terse proof for `device_plain_transformers_ok`.
`device_plain_transformers_ok`:

```
{1}  ∀ (device_read_side_effect,
          device_write_side_effect:
            [[Address, list[Byte], bool] →
                [Device_memory[Physical_memory, pm_phy, Device_state] →
                    ExprResult[Device_memory, list[Byte]]]],
          pm: Plain_Memory[Device_memory]):
       is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
        transformers_ok?(pm`states,
                         (memory_read_transformers(pm`mem, (pm`ro_addr ∪ pm`rw_addr)) ∪ memory_write_t
```

Repeatedly Skolemizing and flattening,
Using lemma pm_dev_states,
Using lemma pm_dev_plain,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using transformers_ok_union_transformers, matching in *,
we get 2 subgoals:
`device_plain_transformers_ok.1`:

```

Q.E.D.

C.22.16 Challenge_Device_Memory.device_memory_plain_memory

Terse proof for `device_memory_plain_memory`.

device_memory_plain_memory:

```
{1}  ∀ (device_read_side_effect,
          device_write_side_effect:
            [[Address, list[Byte], bool] →
                [Device_memory[Physical_memory, pm_phy, Device_state] →
                    ExprResult[Device_memory, list[Byte]]]],
          pm):
       is_device_plain_memory?(device_read_side_effect, device_write_side_effect)(pm) ⊃
        plain_memory?(pm)
```

Expanding the definition of plain_memory?,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 7 subgoals:
device_memory_plain_memory.1:

```
{-1}  is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}   side_effect_content_unchanged(pm′‘rw_addr, pm′‘states, mem-
      ory_write_side_effect(pm′‘mem))
```

Using lemma device_plain_write_side_effect_unchanged,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of device_memory_plain_memory.1.
device_memory_plain_memory.2:

```
{-1}  is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}   side_effect_content_unchanged((pm′‘ro_addr ∪ pm′‘rw_addr), pm′‘states,
                                                  memory_read_side_effect(pm′‘mem))
```

Using lemma device_plain_read_side_effect_unchanged,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of device_memory_plain_memory.2.
device_memory_plain_memory.3:

```
{-1}  is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}   transformers_ok?(pm′‘states,
                       ((memory_read_transformers(pm′‘mem, (pm′‘ro_addr ∪ pm′‘rw_addr)) ∪ memory_write_t
```

Using lemma device_plain_transformers_ok,
Using lemma device_plain_transformers_ok2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using transformers_ok_union_transformers, matching in * where states gets pm!1‘states, transformers_1 gets union(memory_read_transformers(pm!1‘mem, union(pm!1‘ro_addr, pm!1‘rw_addr)), memory_write_transformers(pm!1‘mem, pm!1‘rw_addr)), transformers_2 gets union(memory_read_side_effect_super_transformers(pm!1‘mem, union (pm!1‘ro_addr, pm!1‘rw_addr)), memory_write_side_effect_super_transformers(pm!1‘mem, pm!1‘rw_addr)),
This completes the proof of device_memory_plain_memory.3.
device_memory_plain_memory.4:

```
{-1}  is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}   changed_memory_invariant?(pm′‘mem, pm′‘states, pm′‘rw_addr)
```

Using lemma device_plain_changed_memory_invariant,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of device_memory_plain_memory.4.

`device_memory_plain_memory.5`:

{-1}	is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}	unchanged_memory_write_invariant?(pm′‘mem, pm′‘states, pm′‘rw_addr)

Using lemma device_plain_unchanged_memory_write_invariant,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `device_memory_plain_memory.5`.
`device_memory_plain_memory.6`:

{-1}	is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}	unchanged_memory_invariant?(pm′‘mem, pm′‘states, memory_write_transformers(pm′‘mem, pm′‘rw_addr), pm′‘ro

Using lemma device_plain_unchanged_memory_invariant_write,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `device_memory_plain_memory.6`.
`device_memory_plain_memory.7`:

{-1}	is_device_plain_memory?(device_read_side_effect′, device_write_side_effect′)(pm′)
{1}	unchanged_memory_invariant?(pm′‘mem, pm′‘states, ((pm′‘other_actions ∪ memory_read_transformers(pm′‘mem, (pm (pm′‘ro_addr ∪ pm′‘rw_addr))

Using lemma device_plain_unchanged_memory_invariant,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `device_memory_plain_memory.7`.
Q.E.D.

C.23 Proofs for Challenge_Random_Device (random_device.pvs)

C.23.1 Challenge_Random_Device.IMP_Random_Device_TCC1

Terse proof for `IMP_Random_Device_TCC1`.
`IMP_Random_Device_TCC1`:

{1}	$0 < \text{size}(\text{uidt}(\text{dt\_uint})) \wedge 3 \times \text{size}(\text{uidt}(\text{dt\_uint})) \leq \text{max\_linear\_offset}$

Using lemma dt_uint_size,
This completes the proof of `IMP_Random_Device_TCC1`.
Q.E.D.

C.23.2 Challenge_Random_Device.in_blessed_memory_disjoint_device

Terse proof for `in_blessed_memory_disjoint_device`.
`in_blessed_memory_disjoint_device`:

{1}	$\forall$ (a: Address, l: nat): (address_block(a, l) ⊆ (pm‘ro_addr ∪ pm‘rw_addr)) ⊃ disjoint?(address_block(a, l), address_block(base, size))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `in_blessed_memory_disjoint_device`.
Q.E.D.

C.23.3 Challenge_Random_Device.in_blessed_memory_not_device_address

Terse proof for `in_blessed_memory_not_device_address`.
`in_blessed_memory_not_device_address:`

{1} $\forall$ (a: Address, bl: list[Byte]):
(address_block(a, length(bl)) $\subseteq$ (pm`ro_addr $\cup$ pm`rw_addr)) $\wedge$ cons?(bl) $\supset$
$a \neq$ rnd_seed $\wedge$ $a \neq$ mem_cnt $\wedge$ $a \neq$ rnd_val

Repeatedly Skolemizing and flattening,
Using lemma in_blessed_memory_disjoint_device,
Replacing using formula -3,
Keeping (-1 -4 1) and hiding *,
Expanding the definition of length,
Simplifying, rewriting, and recording with decision procedures,
Adding type constraints for base,
Expanding the definition of disjoint?,
Expanding the definition of empty?,
Instantiating the top quantifier in -5 with the terms: (a!1),
Case splitting on size(uidt(dt_uint)) > 0,
we get 2 subgoals:
`in_blessed_memory_not_device_address.1:`

{-1} size(uidt(dt_uint)) > 0
{-2} Mem?(base`type_of)
{-3} 0 $\leq$ base`offset
{-4} base`offset < max_linear_offset
{-5} base + size[Physical_memory, pm_phy] $\leq$ max_linear
{-6} cons?(bl$'$)

{1} ($a' \in$ (address_block(a', 1 + length(cdr(bl$'$))) $\cap$ address_block(base, size)))
{2} $a' \neq$ rnd_seed $\wedge$ $a' \neq$ mem_cnt $\wedge$ $a' \neq$ rnd_val

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `in_blessed_memory_not_device_address.1`.
`in_blessed_memory_not_device_address.2:`

{-1} Mem?(base`type_of)
{-2} 0 $\leq$ base`offset
{-3} base`offset < max_linear_offset
{-4} base + size[Physical_memory, pm_phy] $\leq$ max_linear
{-5} cons?(bl$'$)

{1} size(uidt(dt_uint)) > 0
{2} ($a' \in$ (address_block(a', 1 + length(cdr(bl$'$))) $\cap$ address_block(base, size)))
{3} $a' \neq$ rnd_seed $\wedge$ $a' \neq$ mem_cnt $\wedge$ $a' \neq$ rnd_val

Using lemma dt_uchar_size,
Using lemma dt_uint_size,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `in_blessed_memory_not_device_address.2`.
Q.E.D.

C.23.4 Challenge_Random_Device.random_side_effects_unchanged_invariant

Terse proof for `random_side_effects_unchanged_invariant`.
`random_side_effects_unchanged_invariant:`

```
|
------------------------------------------------------------------------------
{1}  unchanged_memory_invariant?(pm‘mem, pm‘states,
                                 (drse_super_transformers((pm‘ro_addr ∪ pm‘rw_addr), rnd_dev_r
                                 (pm‘ro_addr ∪ pm‘rw_addr))
```

Installing automatic rewrites from: pm random_device_pm random_device_pm_mem

{2}	side_effect_content_unchanged(pm‘rw_addr, pm‘states, λ (a: Address, bl: list[Byte], cp: bool): write_rnd_dev(a, bl, cp) ## (λ (bl: list[Byte]): reset_count(a, bl, cp)))

Hiding formulas: 2,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `random_side_effects_side_effect_content_unchanged_write.1.3.3.3`.
`random_side_effects_side_effect_content_unchanged_write.2`:

{1}	size(uidt(dt_uint)) > 0
{2}	side_effect_content_unchanged(pm‘rw_addr, pm‘states, rnd_dev_write_side_effect)

Using lemma dt_uint_size,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `random_side_effects_side_effect_content_unchanged_write.2`.
Q.E.D.

C.23.8 Challenge_Random_Device.random_device_plain_memory

Terse proof for `random_device_plain_memory`.

`random_device_plain_memory`:

{1} plain_memory?(pm_phy) ⊃ plain_memory?(pm)

Using lemma device_memory_plain_memory,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of is_device_plain_memory?,
Keeping (1) and hiding *,
Rewriting using random_side_effects_transformers_ok, matching in *,
Rewriting using random_side_effects_unchanged_invariant, matching in *,
Rewriting using random_side_effects_side_effect_content_unchanged_read, matching in *,
Rewriting using random_side_effects_side_effect_content_unchanged_write, matching in *,
Expanding the definition of pm,
Expanding the definition of random_device_pm,
Installing automatic rewrites from: subset_reflexive difference_subset
Expanding the definition of random_device_pm_mem,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `random_device_plain_memory`.
Q.E.D.

C.23.9 Challenge_Random_Device.unaligned_fails_write

Terse proof for `unaligned_fails_write`.

`unaligned_fails_write`:

{1} ∀ (*s*: Random_device_memory, *a*: Address, bl: (cons?[Byte])):
¬ disjoint?(address_block(*a*, length(bl)), address_block(base, size)) ∧
¬ (length(bl) = size(uidt(dt_uint)) ∧
(*a* = rnd_seed ∨ *a* = mem_cnt ∨ *a* = rnd_val))
∧
OK?(memory_write_side_effect(pm_phy‘mem)(*a*, bl, FALSE)(*s*‘state)) ∧
data(memory_write_side_effect(pm_phy‘mem)(*a*, bl, FALSE)(*s*‘state)) = bl
⊃ Fatal?(memory_write_list(pm‘mem)(*a*, bl)(*s*))

Repeatedly Skolemizing and flattening,
Expanding the definition of memory_write_list,
Expanding the definition of pm,
Expanding the definition of random_device_pm,
Expanding the definition of random_device_pm_mem,
Expanding the definition of device_pm,
Expanding the definition of ##,
Expanding the definition of em_lift,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of rnd_dev_write_side_effect,
Expanding the definition of unaligned_access,
Expanding the definition of fatal_result,
Expanding the definition of ##,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `unaligned_fails_write`.
Q.E.D.

C.23.10 Challenge_Random_Device.unaligned_fails_read

Terse proof for `unaligned_fails_read`.

`unaligned_fails_read`:

```
{1}  ∀ (s: Random_device_memory, a: Address, bl: (cons?[Byte])):
       ¬ disjoint?(address_block(a, length(bl)), address_block(base, size)) ∧
        ¬ (length(bl) = size(uidt(dt_uint)) ∧
             (a = rnd_seed ∨ a = mem_cnt ∨ a = rnd_val))
         ∧
         OK?(memory_read_list_nse(pm‘mem)(a, length(bl))(s)) ∧
          (LET ures =
                 (memory_read_list_nse(pm‘mem)(a, length(bl)) ##
                    (λ (bl1: list[Byte]):
                       em_lift
                         [Physical_memory, Random_device_state[Physical_memory, pm_phy],
                          list[Byte]]
                         (memory_read_side_effect(pm_phy‘mem)(a, bl1, FALSE))))
                   (s)
           IN OK?(ures) ∧ length(data(ures)) = length(bl))
        ⊃ Fatal?(memory_read_list(pm‘mem)(a, length(bl))(s))
```

Repeatedly Skolemizing and flattening,

Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of memory_read_list,

Expanding the definition of pm,

Expanding the definition of random_device_pm,

Expanding the definition of random_device_pm_mem,

Expanding the definition of device_pm,

Expanding the definition of rnd_dev_read_side_effect,

Expanding the definition of unaligned_access,

Expanding the definition of ##,

Applying disjunctive simplification to flatten sequent,

Simplifying, rewriting, and recording with decision procedures,

Case splitting on cons?(data(em_lift [Physical_memory, Random_device_state[Physical_memory, pm_phy], list[Byte]] (memory_read_side_effect(pm_phy‘mem) (a!1, data(memory_read_list_nse(pm‘mem) (a!1, length(bl!1)) (s!1)), FALSE)) (state(memory_read_list_nse(pm‘mem) (a!1, length(bl!1)) (s!1))))),

we get 2 subgoals:

```
unaligned_fails_read.1:

{-1}  cons?(data(em_lift

`super_comp_expr_expr_TCC1:`

```
{1}  ∀ (expr: [State → ExprResult[State, Data1]], s, state: State):
       expr_2_super(expr)(s) = OK(state) ⊃
         OK?[State](expr_2_super[State, Data1](expr)(s)) ∨
           abnormal?[State](expr_2_super[State, Data1](expr)(s))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `super_comp_expr_expr_TCC1`.
Q.E.D.

C.29.2 Composition_Simple_Expression_Data_Expression.super_comp_expr_expr_TCC2

Terse proof for `super_comp_expr_expr_TCC2`.
`super_comp_expr_expr_TCC2:`

```
{1}  ∀ (expr: [State → ExprResult[State, Data1]], s, state: State):
       expr_2_super(expr)(s) = OK(state) ⊃ OK?[State, Data1](expr(s))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `super_comp_expr_expr_TCC2`.
Q.E.D.

C.29.3 Composition_Simple_Expression_Data_Expression.super_comp_expr_expr

Terse proof for `super_comp_expr_expr`.
`super_comp_expr_expr:`

```
{1}  ∀ (expr: [State → ExprResult[State, Data1]],
          fexpr: [Data1 → [State → ExprResult[State, Data2]]], s: State):
       expr_2_super(expr ## fexpr)(s) =
        CASES expr_2_super(expr)(s) OF
          OK(state):
            expr_2_super(fexpr(data(expr(s))))(state(expr_2_super(expr)(s)))
          ELSE expr_2_super(expr)(s)
          ENDCASES
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `super_comp_expr_expr`.

Q.E.D.

C.30 Proofs for Composition_Simple_Expression_Data_Statement (state-transformer.pvs)

This theory contains no provable formal statements.

C.31 Proofs for Composition_Simple_Expression_Simple_Expression (state-transformer.pvs)

C.31.1 Composition_Simple_Expression_Simple_Expression.comp_expr_forget_expr

Terse proof for `comp_expr_forget_expr`.

`comp_expr_forget_expr`:

```
{1}  ∀ (expr1: [State → ExprResult[State, Data1]],
          expr2: [State → ExprResult[State, Data2]], s: State):
       (expr1 ## expr2)(s) =
        CASES expr1(s) OF
          OK(state, data): expr2(state),
          Exception(ex_type, state): Exception(ex_type, state),
          Fatal: Fatal,
          Hang: Hang
          ENDCASES
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `comp_expr_forget_expr`.

Q.E.D.

C.31.2 Composition_Simple_Expression_Simple_Expression.super_comp_expr_forget_expr

Terse proof for `super_comp_expr_forget_expr`.

`super_comp_expr_forget_expr`:

```
{1}  ∀ (expr1: [State → ExprResult[State, Data1]],
          expr2: [State → ExprResult[State, Data2]], s: State):
       expr_2_super(expr1 ## expr2)(s) =
        CASES expr_2_super(expr1)(s) OF OK(state): expr_2_super(expr2)(state)
          ELSE expr_2_super(expr1)(s)
          ENDCASES
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `super_comp_expr_forget_expr`.
Q.E.D.

C.31.3 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_TC

Terse proof for `comp_simple_expr_simple_expr_TCC1`.
`comp_simple_expr_simple_expr_TCC1:`

```
{1}  ∀ (expr1: [State → ExprResult[State, Data1]], s: State):
       OK?(expr1(s)) ⊃
        OK?[State, Data1](expr1(s)) ∨ Exception?[State, Data1](expr1(s))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_simple_expr_simple_expr_TCC1`.
Q.E.D.

C.31.4 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr

Terse proof for `comp_simple_expr_simple_expr`.
`comp_simple_expr_simple_expr:`

```
{1}  ∀ (expr1: [State → ExprResult[State, Data1]],
           expr2: [State → ExprResult[State, Data2]], s: State):
       OK?(expr1(s)) ⊃ expr2(state(expr1(s))) = (expr1 ## expr2)(s)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_simple_expr_simple_expr`.
Q.E.D.

C.31.5 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_ok

Terse proof for `comp_simple_expr_simple_expr_ok_TCC1`.
`comp_simple_expr_simple_expr_ok_TCC1:`

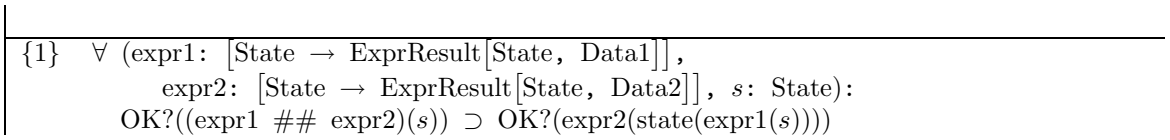
```
{1}  ∀ (expr1: [State → ExprResult[State, Data1]],
           expr2: [State → ExprResult[State, Data2]], s: State):
       OK?((expr1 ## expr2)(s)) ⊃
        OK?[State, Data1](expr1(s)) ∨ Exception?[State, Data1](expr1(s))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_simple_expr_simple_expr_ok_TCC1`.
Q.E.D.

C.31.6 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_ok

Terse proof for `comp_simple_expr_simple_expr_ok`.

`comp_simple_expr_simple_expr_ok`:

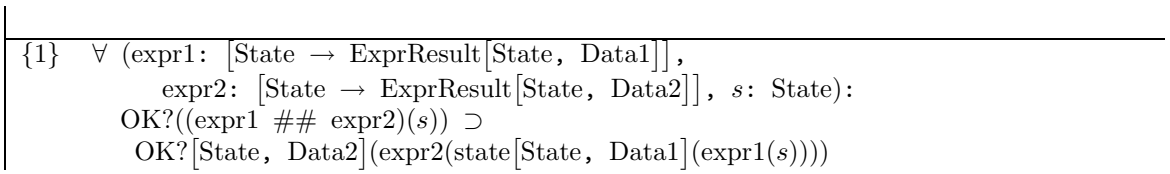


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_simple_expr_simple_expr_ok`.
Q.E.D.

C.31.7 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_data_TCC

Terse proof for `comp_simple_expr_simple_expr_data_TCC1`.

`comp_simple_expr_simple_expr_data_TCC1`:

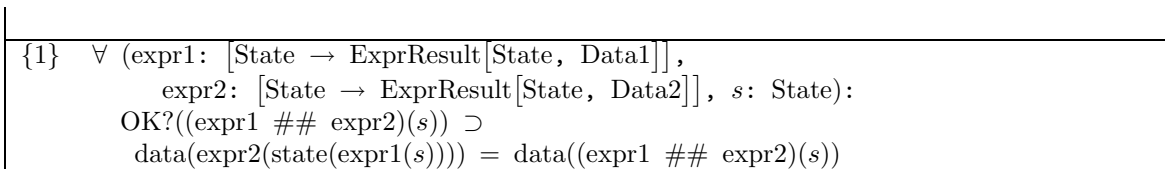


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_simple_expr_simple_expr_data_TCC1`.
Q.E.D.

C.31.8 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_data

Terse proof for `comp_simple_expr_simple_expr_data`.

`comp_simple_expr_simple_expr_data`:

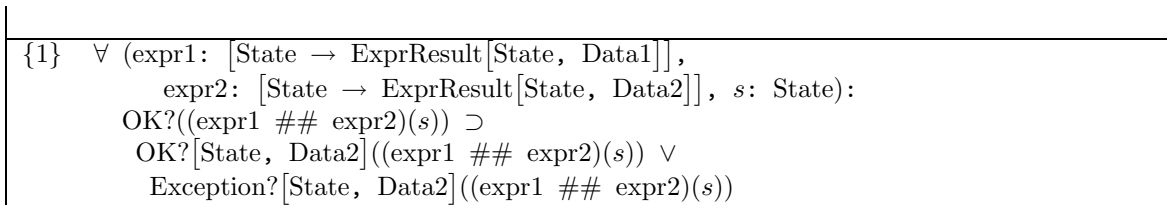


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_simple_expr_simple_expr_data`.
Q.E.D.

C.31.9 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_state_TCC

Terse proof for `comp_simple_expr_simple_expr_state_TCC1`.

comp_simple_expr_simple_expr_state_TCC1:



Trying repeated skolemization, instantiation, and if-lifting,

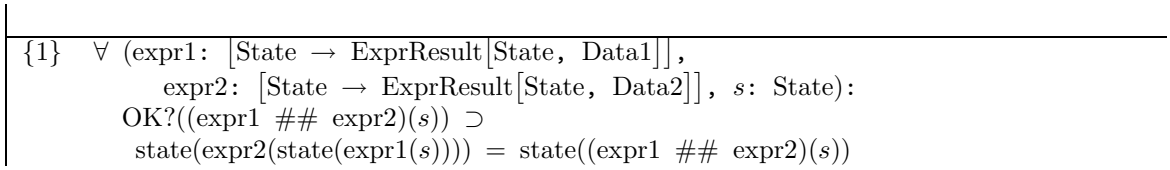
This completes the proof of comp_simple_expr_simple_expr_state_TCC1.

Q.E.D.

C.31.10 Composition_Simple_Expression_Simple_Expression.comp_simple_expr_simple_expr_sta

Terse proof for comp_simple_expr_simple_expr_state.

comp_simple_expr_simple_expr_state:



Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of comp_simple_expr_simple_expr_state.

Q.E.D.

C.32 Proofs for Composition_Simple_Statement_Lifted_Expression (state-transformer.pvs)

This theory contains no provable formal statements.

C.33 Proofs for Composition_Simple_Statement_Lifted_Statement (state-transformer.pvs)

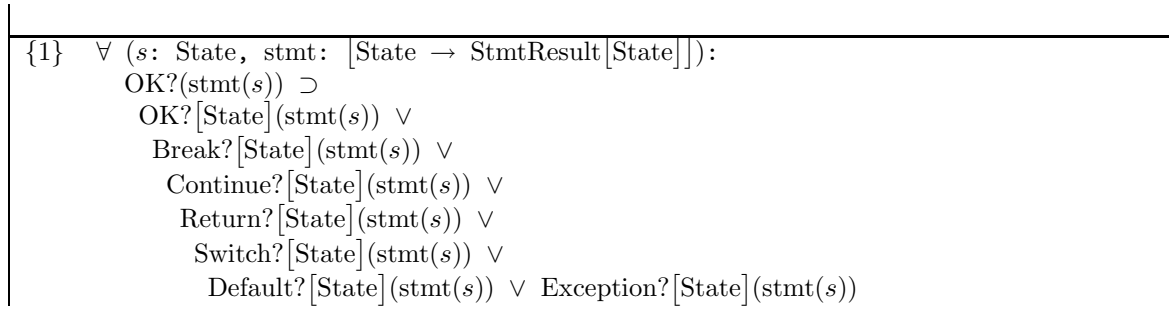
This theory contains no provable formal statements.

C.34 Proofs for Composition_Simple_Statement_Simple_Expression (state-transformer.pvs)

C.34.1 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_TCC1

Terse proof for `comp_simple_stmt_simple_expr_TCC1`.

`comp_simple_stmt_simple_expr_TCC1`:



Trying repeated skolemization, instantiation, and if-lifting,

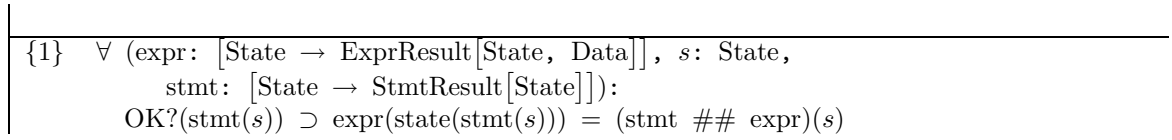
This completes the proof of `comp_simple_stmt_simple_expr_TCC1`.

Q.E.D.

C.34.2 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr

Terse proof for `comp_simple_stmt_simple_expr`.

`comp_simple_stmt_simple_expr`:



Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `comp_simple_stmt_simple_expr`.

Q.E.D.

C.34.3 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_ok_TCC1

Terse proof for `comp_simple_stmt_simple_expr_ok_TCC1`.

comp_simple_stmt_simple_expr_ok_TCC1:

{1} ∀ (expr: [State → ExprResult[State, Data]], s: State,
stmt: [State → StmtResult[State]]):
OK?((stmt ## expr)(s)) ⊃
OK?[State](stmt(s)) ∨
Break?[State](stmt(s)) ∨
Continue?[State](stmt(s)) ∨
Return?[State](stmt(s)) ∨
Switch?[State](stmt(s)) ∨
Default?[State](stmt(s)) ∨ Exception?[State](stmt(s))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of comp_simple_stmt_simple_expr_ok_TCC1.
Q.E.D.

C.34.4 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_ok

Terse proof for comp_simple_stmt_simple_expr_ok.

comp_simple_stmt_simple_expr_ok:

{1} ∀ (expr: [State → ExprResult[State, Data]], s: State,
stmt: [State → StmtResult[State]]):
OK?((stmt ## expr)(s)) ⊃ OK?(expr(state(stmt(s))))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of comp_simple_stmt_simple_expr_ok.
Q.E.D.

C.34.5 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_da

Terse proof for comp_simple_stmt_simple_expr_data_TCC1.

comp_simple_stmt_simple_expr_data_TCC1:

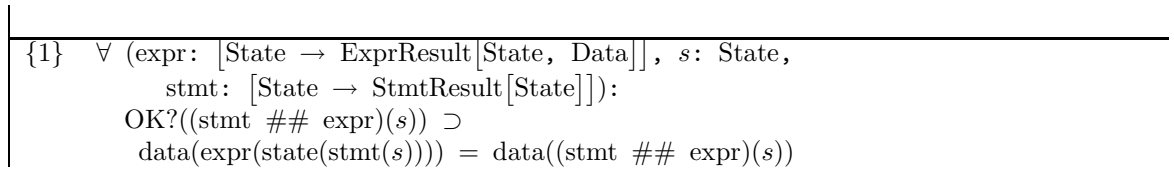
{1} ∀ (expr: [State → ExprResult[State, Data]], s: State,
stmt: [State → StmtResult[State]]):
OK?((stmt ## expr)(s)) ⊃ OK?[State, Data](expr(state[State](stmt(s))))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of comp_simple_stmt_simple_expr_data_TCC1.
Q.E.D.

C.34.6 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_da

Terse proof for comp_simple_stmt_simple_expr_data.

comp_simple_stmt_simple_expr_data:

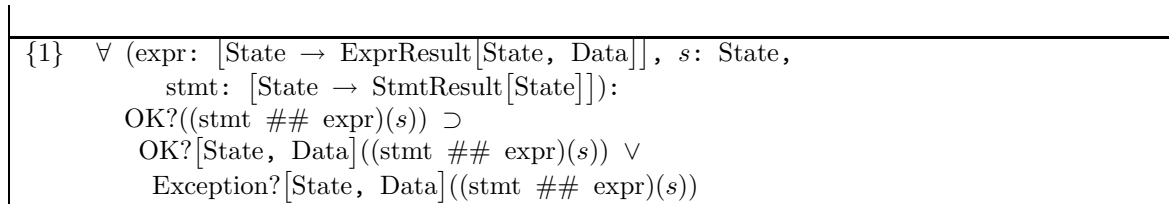


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of comp_simple_stmt_simple_expr_data.
Q.E.D.

C.34.7 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_state_TC

Terse proof for comp_simple_stmt_simple_expr_state_TCC1.

comp_simple_stmt_simple_expr_state_TCC1:

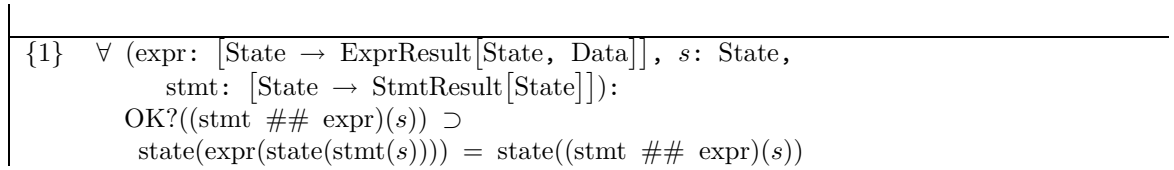


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of comp_simple_stmt_simple_expr_state_TCC1.
Q.E.D.

C.34.8 Composition_Simple_Statement_Simple_Expression.comp_simple_stmt_simple_expr_state

Terse proof for comp_simple_stmt_simple_expr_state.

comp_simple_stmt_simple_expr_state:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of comp_simple_stmt_simple_expr_state.
Q.E.D.

C.35 Proofs for Composition_Simple_Statement_Simple_Statement (state-transformer.pvs)

This theory contains no provable formal statements.

C.36 Proofs for ConditionalExpression (expressions.pvs)

This theory contains no provable formal statements.

C.37 Proofs for Control_Register_Datatype (paging-data.pvs)

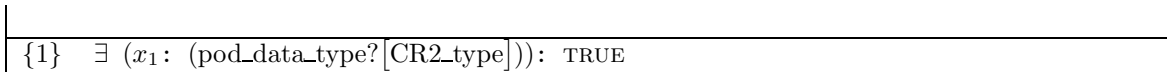
C.37.1 Control_Register_Datatype.cr0_data_type_TCC1

Terse proof for `cr0_data_type_TCC1`.
`cr0_data_type_TCC1:`

Rewriting using cr0_data_type_exists, matching in *,
This completes the proof of `cr0_data_type_TCC1`.
Q.E.D.

C.37.2 Control_Register_Datatype.cr2_data_type_TCC1

Terse proof for `cr2_data_type_TCC1`.
`cr2_data_type_TCC1:`



Rewriting using cr2_data_type_exists, matching in *,
This completes the proof of `cr2_data_type_TCC1`.
Q.E.D.

C.37.3 Control_Register_Datatype.cr4_data_type_TCC1

Terse proof for `cr4_data_type_TCC1`.
`cr4_data_type_TCC1:`

Rewriting using cr4_data_type_exists, matching in *,
This completes the proof of `cr4_data_type_TCC1`.
Q.E.D.

C.38 Proofs for Control_Register_Types (paging-data.pvs)

This theory contains no provable formal statements.

C.39 Proofs for Conversions (conversions.pvs)

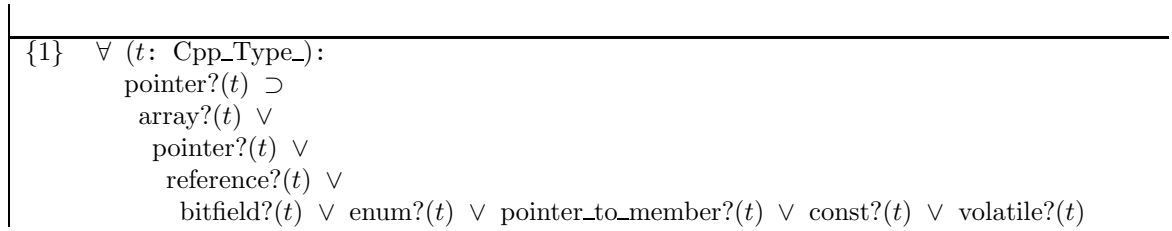
This theory contains no provable formal statements.

C.40 Proofs for Cpp_Deep_Type_Wellformedness (types.pvs)

C.40.1 Cpp_Deep_Type_Wellformedness.no_pointers_to_bitfield?_TCC1

Terse proof for `no_pointers_to_bitfield?_TCC1`.

`no_pointers_to_bitfield?_TCC1:`



Trying repeated skolemization, instantiation, and if-lifting,

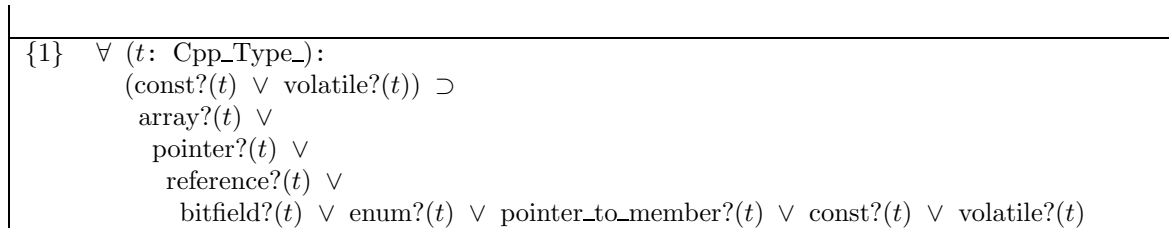
This completes the proof of `no_pointers_to_bitfield?_TCC1`.

Q.E.D.

C.40.2 Cpp_Deep_Type_Wellformedness.no_cv_references?_TCC1

Terse proof for `no_cv_references?_TCC1`.

`no_cv_references?_TCC1:`



Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `no_cv_references?_TCC1`.

Q.E.D.

C.40.3 Cpp_Deep_Type_Wellformedness.no_reference_to_reference?_TCC1

Terse proof for `no_reference_to_reference?_TCC1`.

no_reference_to_reference?_TCC1:

{1} ∀ (t: Cpp_Type_):
reference?(t) ⊃
array?(t) ∨
pointer?(t) ∨
reference?(t) ∨
bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of no_reference_to_reference?_TCC1.
Q.E.D.

C.40.4 Cpp_Deep_Type_Wellformedness.no_array_of_references?_TCC1

Terse proof for no_array_of_references?_TCC1.

no_array_of_references?_TCC1:

{1} ∀ (t: Cpp_Type_):
array?(t) ⊃
array?(t) ∨
pointer?(t) ∨
reference?(t) ∨
bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of no_array_of_references?_TCC1.
Q.E.D.

C.40.5 Cpp_Deep_Type_Wellformedness.no_pointer_or_ref_to_incomplete_array_para

Terse proof for no_pointer_or_ref_to_incomplete_array_parameter?_TCC1.

no_pointer_or_ref_to_incomplete_array_parameter?_TCC1:

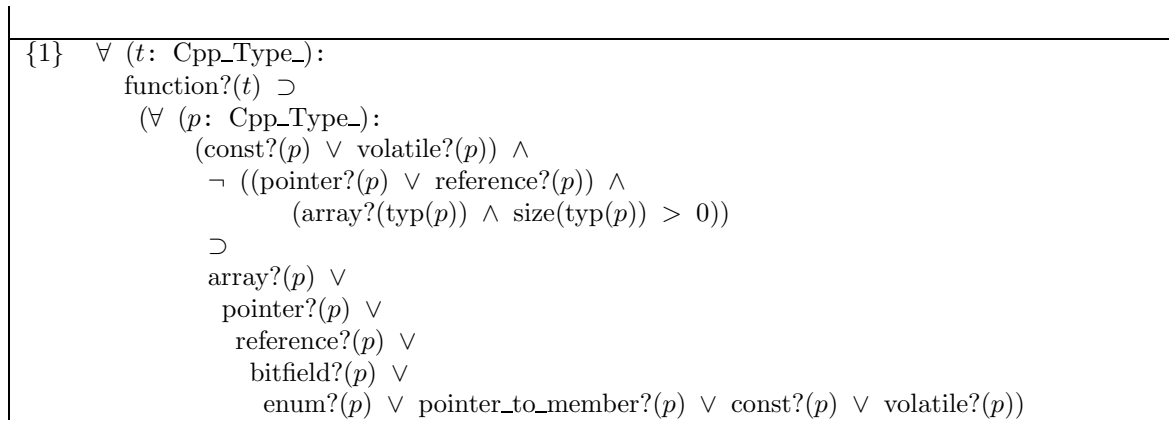
{1} ∀ (t: Cpp_Type_):
function?(t) ⊃
(∀ (p: Cpp_Type_):
(pointer?(p) ∨ reference?(p)) ⊃
array?(p) ∨
pointer?(p) ∨
reference?(p) ∨
bitfield?(p) ∨
enum?(p) ∨ pointer_to_member?(p) ∨ const?(p) ∨ volatile?(p))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of no_pointer_or_ref_to_incomplete_array_parameter?_TCC1.
Q.E.D.

C.40.6 Cpp_Deep_Type_Wellformedness.no_pointer_or_ref_to_incomplete_array_parameter?_

Terse proof for `no_pointer_or_ref_to_incomplete_array_parameter?_TCC2`.

`no_pointer_or_ref_to_incomplete_array_parameter?_TCC2`:



Trying repeated skolemization, instantiation, and if-lifting,

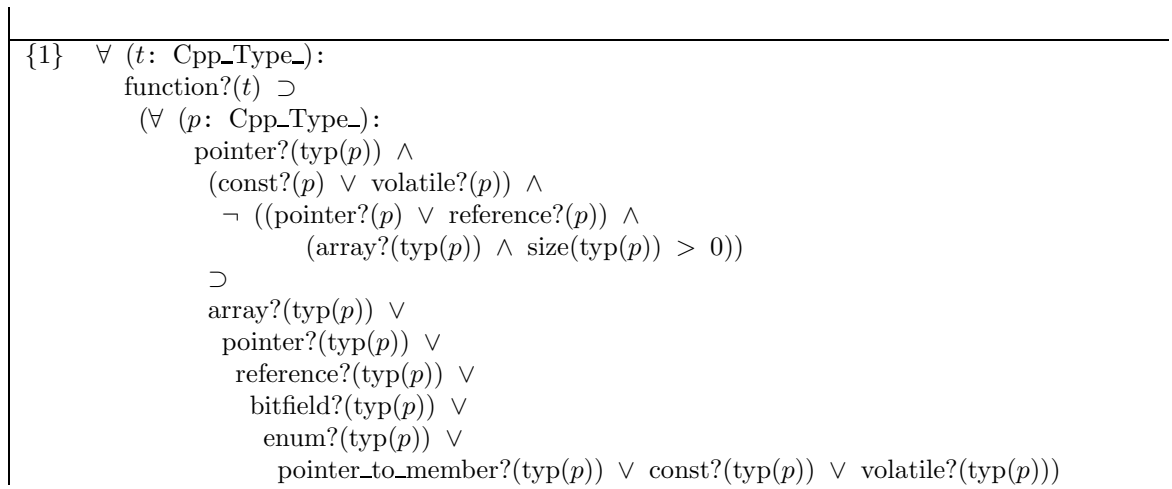
This completes the proof of `no_pointer_or_ref_to_incomplete_array_parameter?_TCC2`.

Q.E.D.

C.40.7 Cpp_Deep_Type_Wellformedness.no_pointer_or_ref_to_incomplete_array_parameter?_

Terse proof for `no_pointer_or_ref_to_incomplete_array_parameter?_TCC3`.

`no_pointer_or_ref_to_incomplete_array_parameter?_TCC3`:



Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `no_pointer_or_ref_to_incomplete_array_parameter?_TCC3`.

Q.E.D.

C.40.8 Cpp_Deep_Type_Wellformedness.no_pointer_or_ref_to_incomplete_array_para

Terse proof for `no_pointer_or_ref_to_incomplete_array_parameter?_TCC4`.

`no_pointer_or_ref_to_incomplete_array_parameter?_TCC4`:

```
{1}   ∀ (t: Cpp_Type_):
        function?(t) ⊃
         (∀ (p: Cpp_Type_):
            const?(p) ∧
             ¬ ((const?(p) ∨ volatile?(p)) ∧
                   pointer?(typ(p)) ∧
                    (array?(typ(typ(p))) ∧ size(typ(typ(p))) > 0))
              ∧
             ¬ ((pointer?(p) ∨ reference?(p)) ∧
                   (array?(typ(p)) ∧ size(typ(p)) > 0))
            ⊃
            array?(p) ∨
             pointer?(p) ∨
              reference?(p) ∨
               bitfield?(p) ∨
                enum?(p) ∨ pointer_to_member?(p) ∨ const?(p) ∨ volatile?(p))
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `no_pointer_or_ref_to_incomplete_array_parameter?_TCC4`.

Q.E.D.

C.40.9 Cpp_Deep_Type_Wellformedness.no_pointer_or_ref_to_incomplete_array_para

Terse proof for `no_pointer_or_ref_to_incomplete_array_parameter?_TCC5`.

`no_pointer_or_ref_to_incomplete_array_parameter?_TCC5`:

```
{1}   ∀ (t: Cpp_Type_):
        function?(t) ⊃
         (∀ (p: Cpp_Type_):
            volatile?(typ(p)) ∧
             const?(p) ∧
              ¬ ((const?(p) ∨ volatile?(p)) ∧
                    pointer?(typ(p)) ∧
                     (array?(typ(typ(p))) ∧ size(typ(typ(p))) > 0))
               ∧
              ¬ ((pointer?(p) ∨ reference?(p)) ∧
                    (array?(typ(p)) ∧ size(typ(p)) > 0))
             ⊃
             array?(typ(p)) ∨
              pointer?(typ(p)) ∨
               reference?(typ(p)) ∨
                bitfield?(typ(p)) ∨
                 enum?(typ(p)) ∨
                  pointer_to_member?(typ(p)) ∨ const?(typ(p)) ∨ volatile?(typ(p)))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `no_pointer_or_ref_to_incomplete_array_parameter?_TCC5`.
Q.E.D.

C.40.10 Cpp_Deep_Type_Wellformedness.no_pointer_or_ref_to_incomplete_array_parameter?_

Terse proof for `no_pointer_or_ref_to_incomplete_array_parameter?_TCC6`.
`no_pointer_or_ref_to_incomplete_array_parameter?_TCC6:`

```
{1}  ∀ (t: Cpp_Type_):
       function?(t) ⊃
        (∀ (p: Cpp_Type_):
           pointer?(typ(typ(p))) ∧
            volatile?(typ(p)) ∧
             const?(p) ∧
              ¬ ((const?(p) ∨ volatile?(p)) ∧
                    pointer?(typ(p)) ∧
                     (array?(typ(typ(p))) ∧ size(typ(typ(p))) > 0))
               ∧
               ¬ ((pointer?(p) ∨ reference?(p)) ∧
                     (array?(typ(p)) ∧ size(typ(p)) > 0))
           ⊃
           array?(typ(typ(p))) ∨
            pointer?(typ(typ(p))) ∨
             reference?(typ(typ(p))) ∨
              bitfield?(typ(typ(p))) ∨
               enum?(typ(typ(p))) ∨
                pointer_to_member?(typ(typ(p))) ∨
                 const?(typ(typ(p))) ∨ volatile?(typ(typ(p))))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `no_pointer_or_ref_to_incomplete_array_parameter?_TCC6`.
Q.E.D.

C.40.11 Cpp_Deep_Type_Wellformedness.bitfield_underlying_integral_or_enum_type?_TCC1

Terse proof for `bitfield_underlying_integral_or_enum_type?_TCC1`.
`bitfield_underlying_integral_or_enum_type?_TCC1:`

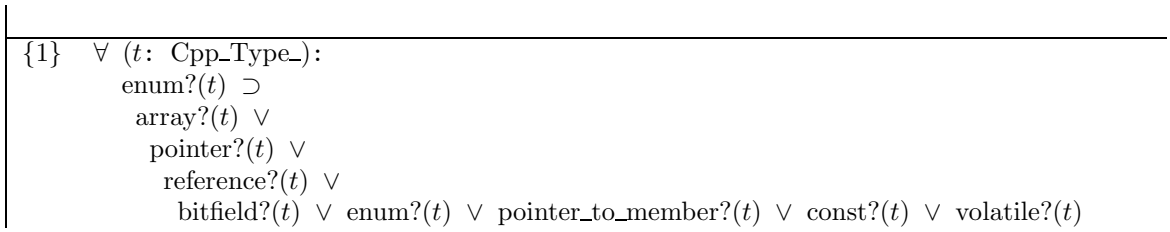
```
{1}  ∀ (t: Cpp_Type_):
       bitfield?(t) ⊃
        array?(t) ∨
         pointer?(t) ∨
          reference?(t) ∨
           bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `bitfield_underlying_integral_or_enum_type?_TCC1`.
Q.E.D.

C.40.12 Cpp_Deep_Type_Wellformedness.enum_underlying_integral?_TCC1

Terse proof for `enum_underlying_integral?_TCC1`.

`enum_underlying_integral?_TCC1:`

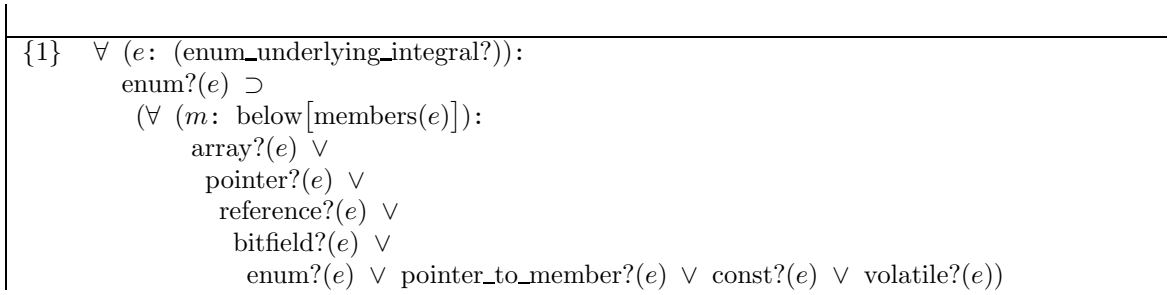


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `enum_underlying_integral?_TCC1`.
Q.E.D.

C.40.13 Cpp_Deep_Type_Wellformedness.enum_constants?_TCC1

Terse proof for `enum_constants?_TCC1`.

`enum_constants?_TCC1:`

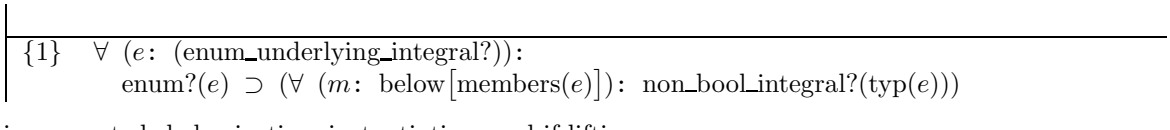


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `enum_constants?_TCC1`.
Q.E.D.

C.40.14 Cpp_Deep_Type_Wellformedness.enum_constants?_TCC2

Terse proof for `enum_constants?_TCC2`.

`enum_constants?_TCC2:`



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `enum_constants?_TCC2`.
Q.E.D.

C.40.15 Cpp_Deep_Type_Wellformedness.const_volatile?_TCC1

Terse proof for `const_volatile?_TCC1`.

`const_volatile?_TCC1:`

{1} ∀ (t: Cpp_Type_):
volatile?(t) ⊃
array?(t) ∨
pointer?(t) ∨
reference?(t) ∨
bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `const_volatile?_TCC1`.
Q.E.D.

C.40.16 Cpp_Deep_Type_Wellformedness.const_stutter?_TCC1

Terse proof for `const_stutter?_TCC1`.

`const_stutter?_TCC1:`

{1} ∀ (t: Cpp_Type_):
const?(t) ⊃
array?(t) ∨
pointer?(t) ∨
reference?(t) ∨
bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `const_stutter?_TCC1`.
Q.E.D.

C.40.17 Cpp_Deep_Type_Wellformedness.cv_array?_TCC1

Terse proof for `cv_array?_TCC1`.

`cv_array?_TCC1:`

{1} ∀ (t: Cpp_Type_):
(volatile?(t) ∨ const?(t)) ⊃
array?(t) ∨
pointer?(t) ∨
reference?(t) ∨
bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cv_array?_TCC1`.
Q.E.D.

C.40.18 Cpp_Deep_Type_Wellformedness.cv_base_TCC1

Terse proof for `cv_base_TCC1`.

cv_base_TCC1:

{1} well_founded?(λ (x: Cpp_Type, y: Cpp_Type):
restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean]
(≪)(x, y))

Using lemma well_founded_restrict[Cpp_Type_, Cpp_Type],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of cv_base_TCC1.
Q.E.D.

C.40.19 Cpp_Deep_Type_Wellformedness.cv_base_TCC2

Terse proof for cv_base_TCC2.
cv_base_TCC2:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_): typ = const(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of cv_base_TCC2.
Q.E.D.

C.40.20 Cpp_Deep_Type_Wellformedness.cv_base_TCC3

Terse proof for cv_base_TCC3.
cv_base_TCC3:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃
restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean](≪)(t, typ)

Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Expanding the definition of ■,
which is trivially true.
This completes the proof of cv_base_TCC3.
Q.E.D.

C.40.21 Cpp_Deep_Type_Wellformedness.cv_base_TCC4

Terse proof for cv_base_TCC4.
cv_base_TCC4:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_): typ = volatile(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_TCC4`.
Q.E.D.

C.40.22 Cpp_Deep_Type_Wellformedness.cv_base_TCC5

Terse proof for `cv_base_TCC5`.

`cv_base_TCC5:`

```
{1}  ∀ (typ: Cpp_Type, t: Cpp_Type_):
       typ = volatile(t) ⊃
        restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean](≪)(t, typ)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of restrict,
Replacing using formula -2,
Expanding the definition of ■,
which is trivially true.
This completes the proof of `cv_base_TCC5`.
Q.E.D.

C.40.23 Cpp_Deep_Type_Wellformedness.subterm_cv_base

Terse proof for `subterm_cv_base`.

`subterm_cv_base:`

```
{1}  ∀ (typ: Cpp_Type): subterm(cv_base(typ), typ)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of cv_base,
Expanding the definition of cv_base,
Lifting IF-conditions to the top level,
Expanding the definition of subterm,
Expanding the definition of subterm,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of Cpp_Type?,
Expanding the definition of const_volatile?,
Expanding the definition of const_stutter?,
Expanding the definition of volatile_stutter?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 5 subgoals:

`subterm_cv_base.1:`

{-1} $\forall$ (t: Cpp_Type_):
subterm(t, typ′) $\supset$
no_pointers_to_bitfield?(t) $\wedge$
no_pointers_to_references?(t) $\wedge$
no_cv_references?(t) $\wedge$
no_reference_to_reference?(t) $\wedge$

{-2} volatile?(cv_base(typ(typ(typ′))))
{-3} volatile?(typ(typ′))
{-4} volatile?(typ′)

Instantiating quantified variables,
Expanding the definition of volatile_stutter?,
Expanding the definition of subterm,
which is trivially true.
This completes the proof of cv_base_not_volatile.4.
Q.E.D.

C.40.28 Cpp_Deep_Type_Wellformedness.cv_base_cv

Terse proof for cv_base_cv.

cv_base_cv:

{1} ∀ (P: PRED[Cpp_Type_], typ: Cpp_Type):
(P ⊆ interpreted?) ⊃ (P(cv_base(typ)) ≡ cv(P)(typ))

Repeatedly Skolemizing and flattening,
Applying propositional simplification,

we get 2 subgoals:
`cv_base_cv.1:`

{-1}	P'(cv_base(typ$'$))
{-2}	Cpp_Type?(typ$'$)
{-3}	($P' \subseteq$ interpreted?)
{1}	cv(P')(typ$'$)

Expanding the definition of cv,
Expanding the definition of c,
Expanding the definition of v,
Applying disjunctive simplification to flatten sequent,
Expanding the definition of cv_base,
Installing automatic rewrites from: subterm const_stutter? volatile_stutter? const_volatile?
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 5 subgoals:
`cv_base_cv.1.1:`

{-1}	const?(typ$'$)
{-2}	P'(cv_base(typ(typ$'$)))
{-3}	Cpp_Type?(typ$'$)
{-4}	($P' \subseteq$ interpreted?)
{1}	P'(typ$'$)
{2}	P'(typ(typ$'$))
{3}	P'(typ(typ(typ$'$)))

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`cv_base_cv.1.1.1:`

{-1}	const?(typ$'$)
{-2}	const?(typ(typ$'$))
{-3}	P'(cv_base(typ(typ(typ$'$))))
{-4}	Cpp_Type?(typ$'$)
{-5}	($P' \subseteq$ interpreted?)
{1}	P'(typ(typ$'$))
{2}	P'(typ$'$)
{3}	P'(typ(typ(typ$'$)))

Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.1.1`.
`cv_base_cv.1.1.2:`

{-1}	const?(typ$'$)
{-2}	P'(cv_base(typ(typ(typ$'$))))
{-3}	volatile?(typ(typ$'$))
{-4}	Cpp_Type?(typ$'$)
{-5}	($P' \subseteq$ interpreted?)
{1}	P'(typ(typ$'$))
{2}	P'(typ$'$)
{3}	P'(typ(typ(typ$'$)))

Expanding the definition of cv_base,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`cv_base_cv.1.1.2.1:`

{-1}	const?(typ′)
{-2}	const?(typ(typ(typ′)))
{-3}	P'(cv_base(typ(typ(typ(typ′)))))
{-4}	volatile?(typ(typ′))
{-5}	Cpp_Type?(typ′)
{-6}	($P' \subseteq$ interpreted?)
{1}	P'(typ(typ(typ′)))
{2}	P'(typ(typ′))
{3}	P'(typ′)

Expanding the definition of Cpp_Type?,

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `cv_base_cv.1.1.2.1`.

`cv_base_cv.1.1.2.2:`

{-1}	const?(typ′)
{-2}	P'(cv_base(typ(typ(typ(typ′)))))
{-3}	volatile?(typ(typ(typ′)))
{-4}	volatile?(typ(typ′))
{-5}	Cpp_Type?(typ′)
{-6}	($P' \subseteq$ interpreted?)
{1}	P'(typ(typ(typ′)))
{2}	P'(typ(typ′))
{3}	P'(typ′)

Expanding the definition of Cpp_Type?,

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `cv_base_cv.1.1.2.2`.

`cv_base_cv.1.2:`

{-1}	P'(cv_base(typ(typ′)))
{-2}	volatile?(typ′)
{-3}	Cpp_Type?(typ′)
{-4}	($P' \subseteq$ interpreted?)
{1}	P'(typ′)
{2}	P'(typ(typ′))
{3}	P'(typ(typ(typ′)))

Expanding the definition of cv_base,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`cv_base_cv.1.2.1:`

{-1}	const?(typ(typ′))
{-2}	P'(cv_base(typ(typ(typ′))))
{-3}	volatile?(typ′)
{-4}	Cpp_Type?(typ′)
{-5}	($P' \subseteq$ interpreted?)
{1}	P'(typ(typ′))
{2}	P'(typ′)
{3}	P'(typ(typ(typ′)))

Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.2.1`.

`cv_base_cv.1.2.2:`

{-1}	P'(cv_base(typ(typ(typ′))))
{-2}	volatile?(typ(typ′))
{-3}	volatile?(typ′)
{-4}	Cpp_Type?(typ′)
{-5}	($P' \subseteq$ interpreted?)
{1}	P'(typ(typ′))
{2}	P'(typ′)
{3}	P'(typ(typ(typ′)))

Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.2.2`.

`cv_base_cv.1.3:`

{-1}	const?(typ′)
{-2}	P'(cv_base(typ(typ′)))
{-3}	Cpp_Type?(typ′)
{-4}	($P' \subseteq$ interpreted?)
{1}	P'(typ′)
{2}	P'(typ(typ′))
{3}	volatile?(typ(typ′))

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.3`.

`cv_base_cv.1.4:`

{-1}	P'(cv_base(typ(typ′)))
{-2}	volatile?(typ′)
{-3}	Cpp_Type?(typ′)
{-4}	($P' \subseteq$ interpreted?)
{1}	P'(typ′)
{2}	P'(typ(typ′))
{3}	volatile?(typ(typ′))

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.4`.
`cv_base_cv.1.5:`

{-1}	$P'(\text{cv\_base}(\text{typ}(\text{typ}')))$
{-2}	volatile?(typ′)
{-3}	Cpp_Type?(typ′)
{-4}	($P' \subseteq$ interpreted?)
{1}	$P'(\text{typ}')$
{2}	$P'(\text{typ}(\text{typ}'))$

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`cv_base_cv.1.5.1:`

{-1}	const?(typ(typ′))
{-2}	$P'(\text{cv\_base}(\text{typ}(\text{typ}(\text{typ}'))))$
{-3}	volatile?(typ′)
{-4}	Cpp_Type?(typ′)
{-5}	($P' \subseteq$ interpreted?)
{1}	$P'(\text{typ}(\text{typ}'))$
{2}	$P'(\text{typ}')$

Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.5.1`.
`cv_base_cv.1.5.2:`

{-1}	$P'(\text{cv\_base}(\text{typ}(\text{typ}(\text{typ}'))))$
{-2}	volatile?(typ(typ′))
{-3}	volatile?(typ′)
{-4}	Cpp_Type?(typ′)
{-5}	($P' \subseteq$ interpreted?)
{1}	$P'(\text{typ}(\text{typ}'))$
{2}	$P'(\text{typ}')$

Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_base_cv.1.5.2`.
`cv_base_cv.2:`

{-1}	$\text{cv}(P')(\text{typ}')$
{-2}	Cpp_Type?(typ′)
{-3}	($P' \subseteq$ interpreted?)
{1}	$P'(\text{cv\_base}(\text{typ}'))$

Rewriting using cv_base_result, matching in * where P gets P!1,
This completes the proof of `cv_base_cv.2`.
Q.E.D.

C.40.29 Cpp_Deep_Type_Wellformedness.layout_compatible?_TCC1

Terse proof for `layout_compatible?_TCC1`.

`layout_compatible?_TCC1:`

{1} ∃ (x: equivalence[Cpp_Type]): TRUE

Instantiating the top quantifier in 1 with the terms: (=),
we get 2 subgoals:

`layout_compatible?_TCC1.1:`

{1} TRUE

which is trivially true.
This completes the proof of `layout_compatible?_TCC1.1`.

`layout_compatible?_TCC1.2:`

{1} equivalence?[Cpp_Type]
(restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean](=))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `layout_compatible?_TCC1.2`.
Q.E.D.

C.40.30 Cpp_Deep_Type_Wellformedness.layout_compatible_enums_TCC1

Terse proof for `layout_compatible_enums_TCC1`.

`layout_compatible_enums_TCC1:`

{1} ∀ (e_1, e_2: Cpp_Subtype(enum?)):
array?(e_1) ∨
pointer?(e_1) ∨
reference?(e_1) ∨
bitfield?(e_1) ∨ enum?(e_1) ∨ pointer_to_member?(e_1) ∨ const?(e_1) ∨ volatile?(e_1)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `layout_compatible_enums_TCC1`.
Q.E.D.

C.40.31 Cpp_Deep_Type_Wellformedness.layout_compatible_enums_TCC2

Terse proof for `layout_compatible_enums_TCC2`.

`layout_compatible_enums_TCC2:`

{1} ∀ (e_1, e_2: Cpp_Subtype(enum?)):
array?(e_2) ∨
pointer?(e_2) ∨
reference?(e_2) ∨
bitfield?(e_2) ∨ enum?(e_2) ∨ pointer_to_member?(e_2) ∨ const?(e_2) ∨ volatile?(e_2)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `layout_compatible_enums_TCC2`.
Q.E.D.

C.41 Proofs for Cpp_Deep_Types (types.pvs)

C.41.1 Cpp_Deep_Types.Cpp_Type__pointer_to_member_eta_TCC1

Terse proof for `Cpp_Type__pointer_to_member_eta_TCC1`.
`Cpp_Type__pointer_to_member_eta_TCC1:`

```
{1}  ∀ (pointer_to_member?_var: (pointer_to_member?)):
       array?(pointer_to_member?_var) ∨
         pointer?(pointer_to_member?_var) ∨
           reference?(pointer_to_member?_var) ∨
             bitfield?(pointer_to_member?_var) ∨
               enum?(pointer_to_member?_var) ∨
                 pointer_to_member?(pointer_to_member?_var) ∨
                   const?(pointer_to_member?_var) ∨ volatile?(pointer_to_member?_var)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `Cpp_Type__pointer_to_member_eta_TCC1`.
Q.E.D.

C.41.2 Cpp_Deep_Types.Cpp_Type__pointer_to_member_eta_TCC2

Terse proof for `Cpp_Type__pointer_to_member_eta_TCC2`.
`Cpp_Type__pointer_to_member_eta_TCC2:`

```
{1}  ∀ (pointer_to_member?_var: (pointer_to_member?)): class?(typ(pointer_to_member?_var))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for typ(pointer_to_member?_var!1),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `Cpp_Type__pointer_to_member_eta_TCC2`.
Q.E.D.

C.41.3 Cpp_Deep_Types.Cpp_Type__typ_pointer_to_member_TCC1

Terse proof for `Cpp_Type__typ_pointer_to_member_TCC1`.
`Cpp_Type__typ_pointer_to_member_TCC1:`

```
{1}  ∀ (pointer_to_member1_var: (class?), pointer_to_member2_var: Cpp_Type_):
       array?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var)) ∨
         pointer?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var)) ∨
           reference?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var)) ∨
             bitfield?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var)) ∨
               enum?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var)) ∨
                 pointer_to_member?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var
                   const?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var)) ∨
                     volatile?(pointer_to_member(pointer_to_member1_var, pointer_to_member2_var))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `Cpp_Type__typ_pointer_to_member_TCC1`.
Q.E.D.

C.41.4 Cpp_Deep_Types.subterm_less

Terse proof for `subterm_less`.
`subterm_less:`

{1} $\forall$ (t_1, t_2: Cpp_Type_): subterm(t_1, t_2) $\wedge$ $t_1 \neq t_2 \supset t_1 \ll t_2$

Inducting on t_2 on formula 1,
we get 28 subgoals:
`subterm_less.1:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, uchar) $\wedge$ $t_1 \neq$ uchar $\supset t_1 \ll$ uchar

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.1`.
`subterm_less.2:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, schar) $\wedge$ $t_1 \neq$ schar $\supset t_1 \ll$ schar

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.2`.
`subterm_less.3:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, char) $\wedge$ $t_1 \neq$ char $\supset t_1 \ll$ char

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.3`.
`subterm_less.4:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, short) $\wedge$ $t_1 \neq$ short $\supset t_1 \ll$ short

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.4`.
`subterm_less.5:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, int) $\wedge$ $t_1 \neq$ int $\supset t_1 \ll$ int

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.5`.
`subterm_less.6:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, long) $\wedge$ $t_1 \neq$ long $\supset t_1 \ll$ long

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.6`.
`subterm_less.7:`

{1} $\forall$ (t_1: Cpp_Type_): subterm(t_1, longlong) $\wedge$ $t_1 \neq$ longlong $\supset t_1 \ll$ longlong

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.7`.
`subterm_less.8:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{ushort}) \wedge t_1 \neq \text{ushort} \supset t_1 \ll \text{ushort}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.8`.
`subterm_less.9:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{uint}) \wedge t_1 \neq \text{uint} \supset t_1 \ll \text{uint}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.9`.
`subterm_less.10:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{ulong}) \wedge t_1 \neq \text{ulong} \supset t_1 \ll \text{ulong}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.10`.
`subterm_less.11:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{ulonglong}) \wedge t_1 \neq \text{ulonglong} \supset t_1 \ll \text{ulonglong}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.11`.
`subterm_less.12:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{wchar\_t}) \wedge t_1 \neq \text{wchar\_t} \supset t_1 \ll \text{wchar\_t}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.12`.
`subterm_less.13:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{bool}) \wedge t_1 \neq \text{bool} \supset t_1 \ll \text{bool}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.13`.
`subterm_less.14:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{float}) \wedge t_1 \neq \text{float} \supset t_1 \ll \text{float}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.14`.
`subterm_less.15:`

$$\{1\} \quad \forall\ (t_1 \texttt{:}\ \text{Cpp\_Type\_})\texttt{:}\ \text{subterm}(t_1\texttt{,}\ \text{double}) \wedge t_1 \neq \text{double} \supset t_1 \ll \text{double}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.15`.

`subterm_less.16:`

{1} ∀ (t_1: Cpp_Type_): subterm(t_1, longdouble) ∧ t_1 ≠ longdouble ⊃ t_1 ≪ longdouble

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `subterm_less.16`.
`subterm_less.17:`

{1} ∀ (t_1: Cpp_Type_): subterm(t_1, void) ∧ t_1 ≠ void ⊃ t_1 ≪ void

Q.E.D.

C.41.5 Cpp_Deep_Types.subterm_transitive

Terse proof for `subterm_transitive`.
`subterm_transitive`:

{1} ∀ (t_1, t_2, t_3: Cpp_Type_): subterm(t_1, t_2) ∧ subterm(t_2, t_3) ⊃ subterm(t_1, t_3)

Using lemma wf_induction[Cpp_Type_, ≪],
For the top quantifier in 1, we introduce Skolem constants: (t1!1 t2!1 _),
Instantiating the top quantifier in -1 with the terms: (LAMBDA (t3: Cpp_Type_): subterm(t1!1, t2!1) AND subterm(t2!1, t3) IMPLIES subterm(t1!1, t3)),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Expanding the definition of subterm,
Splitting conjunctions,
we get 3 subgoals:
`subterm_transitive.1`:

{-1} $t'_2 = x'$
{-2} ∀ (y: Cpp_Type_):
$y \ll x' \supset$ subterm(t'_1, t'_2) ∧ subterm(t'_2, y) ⊃ subterm(t'_1, y)
{-3} subterm(t'_1, t'_2)

{1} subterm(t'_1, x')

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `subterm_transitive.1`.
`subterm_transitive.2`:

{-1} ∀ (y: Cpp_Type_):
$y \ll x' \supset$ subterm(t'_1, t'_2) ∧ subterm(t'_2, y) ⊃ subterm(t'_1, y)
{-2} subterm(t'_1, t'_2)

{1} TRUE
{2} subterm(t'_1, x')

which is trivially true.

This completes the proof of `subterm_transitive.2`.

`subterm_transitive.3:`

This completes the proof of cv_TCC1.
Q.E.D.

C.41.9 Cpp_Deep_Types.cv_TCC2

Terse proof for cv_TCC2.

`cv_TCC2:`

{1} ∀ (p: PRED[Cpp_Type_], typ: Cpp_Type_):
volatile?(typ(typ)) ∧ const?(typ) ∧ ¬ $v(p)$(typ) ∧ ¬ $c(p)$(typ) ⊃
array?(typ(typ)) ∨
pointer?(typ(typ)) ∨
reference?(typ(typ)) ∨
bitfield?(typ(typ)) ∨
enum?(typ(typ)) ∨
pointer_to_member?(typ(typ)) ∨ const?(typ(typ)) ∨ volatile?(typ(typ))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `cv_TCC2`.
Q.E.D.

C.41.10 Cpp_Deep_Types.cv_implied

Terse proof for `cv_implied`.

`cv_implied:`

{1} ∀ (p_1, p_2: PRED[Cpp_Type_], typ: Cpp_Type_):
$(p_1 \subseteq p_2)$ ∧ cv(p_1)(typ) ⊃ cv(p_2)(typ)

Repeatedly Skolemizing and flattening,
Expanding the definition of subset?,
Expanding the definition of member,
Expanding the definition of cv,
Expanding the definition of c,
Expanding the definition of v,
Applying disjunctive simplification to flatten sequent,
Splitting conjunctions,
we get 5 subgoals:

`cv_implied.1:`

{-1} p_1'(typ′)
{-2} ∀ (x: Cpp_Type_): $p_1'(x)$ ⇒ $p_2'(x)$

{1} p_2'(typ′)
{2} (const?(typ′) ∧ p_2'(typ(typ′)))
{3} p_2'(typ′)
{4} (volatile?(typ′) ∧ p_2'(typ(typ′)))
{5} (const?(typ′) ∧ volatile?(typ(typ′)) ∧ p_2'(typ(typ(typ′))))

Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `cv_implied.1`.

`cv_implied.2:`

{-1} (const?(typ′) ∧ p_1'(typ(typ′)))
{-2} ∀ (x: Cpp_Type_): $p_1'(x)$ ⇒ $p_2'(x)$

{1} p_2'(typ′)
{2} (const?(typ′) ∧ p_2'(typ(typ′)))
{3} p_2'(typ′)
{4} (volatile?(typ′) ∧ p_2'(typ(typ′)))
{5} (const?(typ′) ∧ volatile?(typ(typ′)) ∧ p_2'(typ(typ(typ′))))

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `cv_implied.2`.

`cv_implied.3`:

{-1}	$p_1'(\text{typ}')$
{-2}	$\forall\ (x\colon\ \text{Cpp\_Type\_})\colon\ p_1'(x)\ \Rightarrow\ p_2'(x)$
{1}	$p_2'(\text{typ}')$
{2}	$(\text{const?}(\text{typ}')\ \wedge\ p_2'(\text{typ}(\text{typ}')))$
{3}	$p_2'(\text{typ}')$
{4}	$(\text{volatile?}(\text{typ}')\ \wedge\ p_2'(\text{typ}(\text{typ}')))$
{5}	$(\text{const?}(\text{typ}')\ \wedge\ \text{volatile?}(\text{typ}(\text{typ}'))\ \wedge\ p_2'(\text{typ}(\text{typ}(\text{typ}'))))$

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `cv_implied.3`.

`cv_implied.4`:

{-1}	$(\text{volatile?}(\text{typ}')\ \wedge\ p_1'(\text{typ}(\text{typ}')))$
{-2}	$\forall\ (x\colon\ \text{Cpp\_Type\_})\colon\ p_1'(x)\ \Rightarrow\ p_2'(x)$
{1}	$p_2'(\text{typ}')$
{2}	$(\text{const?}(\text{typ}')\ \wedge\ p_2'(\text{typ}(\text{typ}')))$
{3}	$p_2'(\text{typ}')$
{4}	$(\text{volatile?}(\text{typ}')\ \wedge\ p_2'(\text{typ}(\text{typ}')))$
{5}	$(\text{const?}(\text{typ}')\ \wedge\ \text{volatile?}(\text{typ}(\text{typ}'))\ \wedge\ p_2'(\text{typ}(\text{typ}(\text{typ}'))))$

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `cv_implied.4`.

`cv_implied.5`:

{-1}	$(\text{const?}(\text{typ}')\ \wedge\ \text{volatile?}(\text{typ}(\text{typ}'))\ \wedge\ p_1'(\text{typ}(\text{typ}(\text{typ}'))))$
{-2}	$\forall\ (x\colon\ \text{Cpp\_Type\_})\colon\ p_1'(x)\ \Rightarrow\ p_2'(x)$
{1}	$p_2'(\text{typ}')$
{2}	$(\text{const?}(\text{typ}')\ \wedge\ p_2'(\text{typ}(\text{typ}')))$
{3}	$p_2'(\text{typ}')$
{4}	$(\text{volatile?}(\text{typ}')\ \wedge\ p_2'(\text{typ}(\text{typ}')))$
{5}	$(\text{const?}(\text{typ}')\ \wedge\ \text{volatile?}(\text{typ}(\text{typ}'))\ \wedge\ p_2'(\text{typ}(\text{typ}(\text{typ}'))))$

Instantiating quantified variables,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `cv_implied.5`.

Q.E.D.

C.41.11 Cpp_Deep_Types.pod?_TCC1

Terse proof for `pod?_TCC1`.

`pod?_TCC1:`

{1} ∀ (t: Cpp_Type_):
array?(t) ∧
¬ (class?(t) ∧ (pod_struct?(t) ∨ pod_union?(t))) ∧ ¬ scalar?(t)
⊃
array?(t) ∨
pointer?(t) ∨
reference?(t) ∨
bitfield?(t) ∨ enum?(t) ∨ pointer_to_member?(t) ∨ const?(t) ∨ volatile?(t)

Repeatedly Skolemizing and flattening,
This completes the proof of `pod?_TCC1`.
Q.E.D.

C.41.12 Cpp_Deep_Types.uidt_void_TCC1

Terse proof for `uidt_void_TCC1`.

`uidt_void_TCC1:`

{1} uninterpreted_data_type?((#size := 0, valid? := λ (l: list[Byte], a: Address): FALSE#))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_void_TCC1`.
Q.E.D.

C.42 Proofs for Cpp_Examples (cpp-examples.pvs)

C.42.1 Cpp_Examples.spec01

Terse proof for `spec01`.

`spec01:`

Q.E.D.

C.42.2 Cpp_Examples.PRECONDITION_TCC1

Terse proof for `PRECONDITION_TCC1`.

`PRECONDITION_TCC1:`

{1} ∀ (*s*: State): pm‘states(*s*) ⊃ Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
PRECONDITION_TCC1.1:

{-1}	pm‘states(s')
{1}	Cpp_Type?(int)

Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Expanding the definition of Cpp_Type?,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of PRECONDITION_TCC1.1.
PRECONDITION_TCC1.2:

{-1}	pm‘states(s')
{1}	cv(non_bool_integral_enum?)(int)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of PRECONDITION_TCC1.2.
Q.E.D.

C.42.3 Cpp_Examples.PRECONDITION_TCC2

Terse proof for PRECONDITION_TCC2.
PRECONDITION_TCC2:

{1}	$\forall$ (s: State): in_blessed_memory?(dt_bool, c, pm‘rw_addr) $\wedge$ in_blessed_memory?(dt(int), m, pm‘rw_addr) $\wedge$ in_blessed_memory?(dt(int), n, pm‘rw_addr) $\wedge$ pm‘states(s) $\supset$ Cpp_Type?(char) $\wedge$ cv(non_bool_integral_enum?)(char)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
PRECONDITION_TCC2.1:

{-1}	in_blessed_memory?(dt_bool, c, pm‘rw_addr)
{-2}	in_blessed_memory?(dt(int), m, pm‘rw_addr)
{-3}	in_blessed_memory?(dt(int), n, pm‘rw_addr)
{-4}	pm‘states(s')
{1}	Cpp_Type?(char)

Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields?

no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_par
no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array?
enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter?
no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?

Expanding the definition of Cpp_Type?,

Expanding the definition of subterm,

Repeatedly Skolemizing and flattening,

Replacing using formula -1,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `PRECONDITION_TCC2.1`.

`PRECONDITION_TCC2.2:`

{-1}	in_blessed_memory?(dt_bool, c, pm‘rw_addr)
{-2}	in_blessed_memory?(dt(int), m, pm‘rw_addr)
{-3}	in_blessed_memory?(dt(int), n, pm‘rw_addr)
{-4}	pm‘states(s')
{1}	cv(non_bool_integral_enum?)(char)

Keeping (1) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `PRECONDITION_TCC2.2`.

Q.E.D.

C.42.4 Cpp_Examples.PRECONDITION_TCC3

Terse proof for `PRECONDITION_TCC3`.

`PRECONDITION_TCC3:`

{1} $\forall$ (s: State):
in_blessed_memory?(dt(char), b, pm‘rw_addr) $\wedge$
in_blessed_memory?(dt(char), a, pm‘rw_addr) $\wedge$
in_blessed_memory?(dt_bool, c, pm‘rw_addr) $\wedge$
in_blessed_memory?(dt(int), m, pm‘rw_addr) $\wedge$
in_blessed_memory?(dt(int), n, pm‘rw_addr) $\wedge$ pm‘states(s)
$\supset$ Cpp_Type?(char)

Repeatedly Skolemizing and flattening,

Using lemma PRECONDITION_TCC2,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `PRECONDITION_TCC3`.

Q.E.D.

C.42.5 Cpp_Examples.PRECONDITION_TCC4

Terse proof for `PRECONDITION_TCC4`.

PRECONDITION_TCC4:

{1} ∀ (s: State):
blocks_disjoint?(b, size_of(char), a, size_of(char)) ∧
blocks_disjoint?(a, size_of(char), b, size_of(char)) ∧
in_blessed_memory?(dt(char), b, pm‘rw_addr) ∧
in_blessed_memory?(dt(char), a, pm‘rw_addr) ∧
in_blessed_memory?(dt_bool, c, pm‘rw_addr) ∧
in_blessed_memory?(dt(int), m, pm‘rw_addr) ∧
in_blessed_memory?(dt(int), n, pm‘rw_addr) ∧ pm‘states(s)
⊃ Cpp_Type?(int)

Repeatedly Skolemizing and flattening,
Using lemma PRECONDITION_TCC1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of PRECONDITION_TCC4.
Q.E.D.

C.42.6 Cpp_Examples.POSTCONDITION_TCC1

Terse proof for POSTCONDITION_TCC1.
POSTCONDITION_TCC1:

{1} ∀ (s: State): Cpp_Type?(int) ∧ cv(non_bool_integral_enum?)(int)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
POSTCONDITION_TCC1.1:

{1} Cpp_Type?(int)

Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_parameter? no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?
Expanding the definition of Cpp_Type?,
Expanding the definition of subterm,
Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of POSTCONDITION_TCC1.1.
POSTCONDITION_TCC1.2:

{1} cv(non_bool_integral_enum?)(int)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of POSTCONDITION_TCC1.2.
Q.E.D.

C.42.7 Cpp_Examples.spec02_TCC1

Terse proof for `spec02_TCC1`.

`spec02_TCC1:`

{1} plain_memory?(pm) ⊃ range(int)(42)

Applying disjunctive simplification to flatten sequent,
Expanding the definition of range,
Expanding the definition of range_integral,
Rewriting using int_binary, matching in *,
Using lemma min_int,
Using lemma max_int,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `spec02_TCC1`.
Q.E.D.

C.42.8 Cpp_Examples.spec02

Terse proof for `spec02`.

`spec02:`

This completes the proof of `spec03`.

Q.E.D.

C.42.10 Cpp_Examples.spec04_TCC1

Terse proof for `spec04_TCC1`.

`spec04_TCC1:`

```
{1}  plain_memory?(pm) ⊃ range(char)(42)
```

Applying disjunctive simplification to flatten sequent,

Expanding the definition of range,

Expanding the definition of range_integral,

Rewriting using char_binary, matching in *,

Using lemma min_char,

Using lemma max_char,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `spec04_TCC1`.

Q.E.D.

C.42.11 Cpp_Examples.spec04_TCC2

Terse proof for `spec04_TCC2`.

`spec04_TCC2:`

```
{1}  plain_memory?(pm) ⊃ Cpp_Type?(char) ∧ cv(non_bool_integral_enum?)(char)
```

Repeatedly Skolemizing and flattening,

Hiding formulas: -1,

Applying propositional simplification,

we get 2 subgoals:

`spec04_TCC2.1:`

```
{1}  Cpp_Type?(char)
```

Expanding the definition of Cpp_Type?,

Expanding the definition of subterm,

Repeatedly Skolemizing and flattening,

Replacing using formula -1,

Installing automatic rewrites from: no_pointers_to_bitfield? no_pointers_to_references? no_cv_references? no_reference_to_reference? no_reference_to_bitfields? no_pointer_to_member_to_reference? no_pointer_to_member_to_cv_void? no_cv_void_parameter? no_array_of_references? no_array_of_bitfields? no_array_of_cv_void? no_array_of_function? no_array_of_abstract_class? no_pointer_or_ref_to_incomplete_array_par no_array_return_type? no_function_return_type? bitfield_underlying_integral_or_enum_type? cv_array? enum_underlying_integral? enum_constants? const_volatile? const_stutter? volatile_stutter? no_cv_class? no_cv_union? no_cv_function? no_reference_to_void? no_cv_void?

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `spec04_TCC2.1`.

`spec04_TCC2.2`:

```
{1}  cv(non_bool_integral_enum?)(char)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `spec04_TCC2.2`.

Q.E.D.

data(read_data(pm, dt(int))(n)(s)) = N)

This completes the proof of spec10.

C.43 Proofs for Cpp_Integral_Types (types.pvs)

C.43.1 Cpp_Integral_Types.range_integral_TCC1

Terse proof for range_integral_TCC1.

range_integral_TCC1:

{1} ∀ (typ: (non_bool_integral?)):
typ = uchar ⊃ ¬ empty?[int](extend[int, nat, bool, FALSE](range_uchar))

Repeatedly Skolemizing and flattening,
Adding type constraints for range_uchar,
Keeping (-4 1) and hiding *,

Expanding the definition of empty?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_integral_TCC1`.
Q.E.D.

C.43.2 Cpp_Integral_Types.range_integral_TCC2

Terse proof for `range_integral_TCC2`.

`range_integral_TCC2`:

```
{1}   ∀ (typ: (non_bool_integral?)):
        typ = ushort ⊃ ¬ empty?[int](extend[int, nat, bool, FALSE](range_ushort))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for range_ushort,
Keeping (-4 1) and hiding *,
Expanding the definition of empty?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_integral_TCC2`.
Q.E.D.

C.43.3 Cpp_Integral_Types.range_integral_TCC3

Terse proof for `range_integral_TCC3`.

`range_integral_TCC3`:

```
{1}   ∀ (typ: (non_bool_integral?)):
        typ = uint ⊃ ¬ empty?[int](extend[int, nat, bool, FALSE](range_uint))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for range_uint,
Keeping (-4 1) and hiding *,
Expanding the definition of empty?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_integral_TCC3`.
Q.E.D.

C.43.4 Cpp_Integral_Types.range_integral_TCC4

Terse proof for `range_integral_TCC4`.

`range_integral_TCC4`:

```
{1}   ∀ (typ: (non_bool_integral?)):
        typ = ulong ⊃ ¬ empty?[int](extend[int, nat, bool, FALSE](range_ulong))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for range_ulong,
Keeping (-4 1) and hiding *,
Expanding the definition of empty?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_integral_TCC4`.
Q.E.D.

C.43.5 Cpp_Integral_Types.range_integral_TCC5

Terse proof for `range_integral_TCC5`.
`range_integral_TCC5:`

```
{1}  ∀ (typ: (non_bool_integral?)):
       typ = ulonglong ⊃ ¬ empty?[int](extend[int, nat, bool, FALSE](range_ulonglong))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for range_ulonglong,
Keeping (-4 1) and hiding *,
Expanding the definition of empty?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_integral_TCC5`.
Q.E.D.

C.43.6 Cpp_Integral_Types.range_integral_TCC6

Terse proof for `range_integral_TCC6`.
`range_integral_TCC6:`

```
{1}  ∀ (typ: (non_bool_integral?)):
       ¬ (bool?(typ) ∨
            float?(typ) ∨
              double?(typ) ∨
                longdouble?(typ) ∨
                  void?(typ) ∨
                    array?(typ) ∨
                      function?(typ) ∨
                        pointer?(typ) ∨
                          reference?(typ) ∨
                            class?(typ) ∨
                              union?(typ) ∨
                                bitfield?(typ) ∨
                                  enum?(typ) ∨ pointer_to_member?(typ) ∨ const?(typ) ∨ volatile?(typ))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of non_bool_integral?,
Expanding the definition of signed_integer?,
Expanding the definition of unsigned_integer?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_integral_TCC6`.
Q.E.D.

C.43.7 Cpp_Integral_Types.range_floating_point_TCC1

Terse proof for `range_floating_point_TCC1`.

`range_floating_point_TCC1`:

```
{1}   ∀ (typ: (floating_point?)):
        ¬ (uchar?(typ) ∨
             schar?(typ) ∨
              char?(typ) ∨
               short?(typ) ∨
                int?(typ) ∨
                 long?(typ) ∨
                  longlong?(typ) ∨
                   ushort?(typ) ∨
                    uint?(typ) ∨
                     ulong?(typ) ∨
                      ulonglong?(typ) ∨
                       wchar_t?(typ) ∨
                        bool?(typ) ∨
                         void?(typ) ∨
                          array?(typ) ∨
                           function?(typ) ∨
                            pointer?(typ) ∨
                             reference?(typ) ∨
                              class?(typ) ∨
                               union?(typ) ∨
                                bitfield?(typ) ∨
                                 enum?(typ) ∨
                                  pointer_to_member?(typ) ∨ const?(typ) ∨ volatile?(typ))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of floating_point?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_floating_point_TCC1`.
Q.E.D.

C.43.8 Cpp_Integral_Types.dt_integral_TCC1

Terse proof for `dt_integral_TCC1`.

`dt_integral_TCC1`:

```
{1}   ∀ (typ: (non_bool_integral?)):
        typ = uchar ⊃
         (∀ (x: int): x ≥ 0 ∧ (range_uchar)(x) ≡ range_integral(typ)(x)) ∧
          (∀ (x: int): x ≥ 0 ∧ (range_uchar)(x) ≡ range_integral(typ)(x)) ∧
           (∀ (x1: [list[Byte], Address]):
                every[(range_uchar)]((range_integral(typ)))(dt_uchar`from_byte(x1)))
            ∧ pod_data_type?[(range_integral(typ))](dt_uchar)
```

Repeatedly Skolemizing and flattening,

Replacing using formula -2,

Expanding the definition of range_integral,

Expanding the definition of extend,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 3 subgoals:

`dt_integral_TCC1.1:`

{-1} non_bool_integral?(uchar)
{-2} uchar?(typ′)

{1} pod_data_type?⌊((range_integral(typ′)))⌋(dt_uchar)

Adding type constraints for dt_uchar,

Expanding the definition of pod_data_type?,

Applying propositional simplification,

Expanding the definition of interpreted_data_type?,

Applying propositional simplification,

we get 2 subgoals:

`dt_integral_TCC1.1.1:`

{-1} uninterpreted_data_type?(dt_uchar`uidt)
{-2} ∀ (d: ((range_uchar)), a: Address):
valid?(uidt(dt_uchar))(to_byte(dt_uchar)(d, a), a)
{-3} ∀ (l: list[Byte], a: Address):
valid?(uidt(dt_uchar))(l, a) ≡ up?(from_byte(dt_uchar)(l, a))
{-4} ∀ (d: ((range_uchar)), a: Address):
down(from_byte(dt_uchar)(to_byte(dt_uchar)(d, a), a)) = d
{-5} ∀ (l: list[Byte], a_1, a_2: Address):
valid?(uidt(dt_uchar))(l, a_1) ≡ valid?(uidt(dt_uchar))(l, a_2)
{-6} size(uidt(dt_uchar)) > 0
{-7} non_bool_integral?(uchar)
{-8} uchar?(typ′)

{1} ∀ (d: ((range_integral(typ′))), a: Address):
valid?(uidt(dt_uchar))(to_byte(dt_uchar)(d, a), a)

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Expanding the definition of range_integral,

Expanding the definition of extend,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_integral_TCC1.1.1`.

`dt_integral_TCC1.1.2`:

{-1}	uninterpreted_data_type?(dt_uchar‘uidt)
{-2}	∀ (d: ((range_uchar)), a: Address): valid?(uidt(dt_uchar))(to_byte(dt_uchar)(d, a), a)
{-3}	∀ (l: list[Byte], a: Address): valid?(uidt(dt_uchar))(l, a) ≡ up?(from_byte(dt_uchar)(l, a))
{-4}	∀ (d: ((range_uchar)), a: Address): down(from_byte(dt_uchar)(to_byte(dt_uchar)(d, a), a)) = d
{-5}	∀ (l: list[Byte], a_1, a_2: Address): valid?(uidt(dt_uchar))(l, a_1) ≡ valid?(uidt(dt_uchar))(l, a_2)
{-6}	size(uidt(dt_uchar)) > 0
{-7}	non_bool_integral?(uchar)
{-8}	uchar?(typ′)
{1}	∀ (d: ((range_integral(typ′))), a: Address): down(from_byte(dt_uchar)(to_byte(dt_uchar)(d, a), a)) = d

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of range_integral,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_integral_TCC1.1.2`.

`dt_integral_TCC1.2`:

{-1}	non_bool_integral?(uchar)
{-2}	uchar?(typ′)
{1}	∀ (x_1: [list[Byte], Address]): every[(range_uchar)]((range_integral(uchar)))(dt_uchar‘from_byte(x_1))

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Expanding the definition of range_integral,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of extend,
which is trivially true.
This completes the proof of `dt_integral_TCC1.2`.

`dt_integral_TCC1.3`:

{-1}	non_bool_integral?(uchar)
{-2}	uchar?(typ′)
{1}	∀ (x: int): $x \geq 0 \wedge$ (range_uchar)(x) ≡ IF $x \geq 0$ THEN range_uchar(x) ELSE FALSE ENDIF

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_integral_TCC1.3`.
Q.E.D.

C.43.9 Cpp_Integral_Types.dt_integral_TCC2

Terse proof for `dt_integral_TCC2`.

`dt_integral_TCC2:`

```
{1}  ∀ (typ: (non_bool_integral?)):
       typ = schar ⊃
        (∀ (x: int): (range_schar)(x) ≡ range_integral(typ)(x)) ∧
         (∀ (x: int): (range_schar)(x) ≡ range_integral(typ)(x)) ∧
          (∀ (x1: [list[Byte], Address]):
               every[(range_schar)]((range_integral(typ)))(dt_schar`from_byte(x1)))
           ∧ pod_data_type?[(range_integral(typ))](dt_schar)
```

Repeatedly Skolemizing and flattening,

Replacing using formula -2,

Expanding the definition of range_integral,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`dt_integral_TCC2.1:`

```
{-1}  non_bool_integral?(schar)
{-2}  schar?(typ′)
------------------------------------------------------------
{1}   pod_data_type?[((range_integral(typ′)))](dt_schar)
```

Adding type constraints for dt_schar,

Expanding the definition of pod_data_type?,

Applying propositional simplification,

Expanding the definition of interpreted_data_type?,

Applying propositional simplification,

we get 2 subgoals:

`dt_integral_TCC2.1.1:`

```
{-1}  uninterpreted_data_type?(dt_schar`uidt)
{-2}  ∀ (d: ((range_schar)), a: Address):
        valid?(uidt(dt_schar))(to_byte(dt_schar)(d, a), a)

{-1} non_bool_integral?(long)
{-2} long?(typ′)

{1} $\forall\ (x_1\colon\ \lfloor\text{list}\lfloor\text{Byte}\rfloor,\ \text{Address}\rfloor)\colon$
$\text{every}\lfloor(\text{range\_long})\rfloor((\text{range\_integral}(\text{long})))(\text{dt\_long`from\_byte}(x_1))$

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Expanding the definition of range_integral,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_integral_TCC6.2`.
Q.E.D.

C.43.14 Cpp_Integral_Types.dt_integral_TCC7

Terse proof for `dt_integral_TCC7`.
`dt_integral_TCC7:`

{1} $\forall\ (\text{typ}\colon\ (\text{non\_bool\_integral?}))\colon$
$\text{typ} = \text{longlong} \supset$
$(\forall\ (x\colon\ \text{int})\colon\ (\text{range\_longlong})(x) \equiv \text{range\_integral}(\text{typ})(x)) \wedge$
$(\forall\ (x\colon\ \text{int})\colon\ (\text{range\_longlong})(x) \equiv \text{range\_integral}(\text{typ})(x)) \wedge$
$(\forall\ (x_1\colon\ \lfloor\text{list}\lfloor\text{Byte}\rfloor,\ \text{Address}\rfloor)\colon$
$\text{every}\lfloor(\text{range\_longlong})\rfloor((\text{range\_integral}(\text{typ})))(\text{dt\_longlong`from\_byte}(x_1)))$
$\wedge\ \text{pod\_data\_type?}\lfloor(\text{range\_integral}(\text{typ}))\rfloor(\text{dt\_longlong})$

Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Expanding the definition of range_integral,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`dt_integral_TCC7.1:`

{-1} non_bool_integral?(longlong)
{-2} longlong?(typ′)

{1} $\text{pod\_data\_type?}\lfloor((\text{range\_integral}(\text{typ}')))\rfloor(\text{dt\_longlong})$

Adding type constraints for dt_longlong,
Expanding the definition of pod_data_type?,
Applying propositional simplification,
Expanding the definition of interpreted_data_type?,
Applying propositional simplification,
we get 2 subgoals:

`dt_integral_TCC7.1.1:`

```
{-1}  uninterpreted_data_type?(dt_longlong`uidt)
{-2}  ∀ (d: ((range_longlong)), a: Address):
        valid?(uidt(dt_longlong))(to_byte(dt_longlong)(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_longlong))(l, a) ≡ up?(from_byte(dt_longlong)(l, a))
{-4}  ∀ (d: ((range_longlong)), a: Address):
        down(from_byte(dt_longlong)(to_byte(dt_longlong)(d, a), a)) = d
{-5}  ∀ (l: list[Byte], a1, a2: Address):
        valid?(uidt(dt_longlong))(l, a1) ≡ valid?(uidt(dt_longlong))(l, a2)
{-6}  size(uidt(dt_longlong)) > 0
{-7}  non_bool_integral?(longlong)
{-8}  longlong?(typ′)
------------------------------------------------------------------------
{1}   ∀ (d: ((range_integral(typ′))), a: Address):
        valid?(uidt(dt_longlong))(to_byte(dt_longlong)(d, a), a)
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of range_integral,
which is trivially true.
This completes the proof of `dt_integral_TCC7.1.1`.
`dt_integral_TCC7.1.2:`

```
{-1}  uninterpreted_data_type?(dt_longlong`uidt)
{-2}  ∀ (d: ((range_longlong)), a: Address):

           ∧ pod_data_type?[(range_integral(typ))](dt_wchar_t)
```

Repeatedly Skolemizing and flattening,

Replacing using formula -2,

Expanding the definition of range_integral,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`dt_integral_TCC12.1:`

```
{-1}  non_bool_integral?(wchar_t)
{-2}  wchar_t?(typ')
------------------------------------------------------------
{1}   pod_data_type?[((range_integral(typ')))](dt_wchar_t)
```

Adding type constraints for dt_wchar_t,

Expanding the definition of pod_data_type?,

Applying propositional simplification,

Expanding the definition of interpreted_data_type?,

Applying propositional simplification,

we get 2 subgoals:

`dt_integral_TCC12.1.1:`

```
{-1}  uninterpreted_data_type?(dt_wchar_t`uidt)
{-2}  ∀ (d: ((range_wchar_t)), a: Address):
        valid?(uidt(dt_wchar_t))(to_byte(dt_wchar_t)(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_wchar_t))(l, a) ≡ up?(from_byte(dt_wchar_t)(l, a))
{-4}  ∀ (d: ((range_wchar_t)), a: Address):
        down(from_byte(dt_wchar_t)(to_byte(dt_wchar_t)(d, a), a)) = d
{-5}  ∀ (l: list[Byte], a1, a2: Address):
        valid?(uidt(dt_wchar_t))(l, a1) ≡ valid?(uidt(dt_wchar_t))(l, a2)
{-6}  size(uidt(dt_wchar_t)) > 0
{-7}  non_bool_integral?(wchar_t)
{-8}  wchar_t?(typ')
------------------------------------------------------------
{1}   ∀ (d: ((range_integral(typ'))), a: Address):
        valid?(uidt(dt_wchar_t))(to_byte(dt_wchar_t)(d, a), a)
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Expanding the definition of range_integral,

which is trivially true.

This completes the proof of `dt_integral_TCC12.1.1`.

`dt_integral_TCC12.1.2:`

```
{-1}  uninterpreted_data_type?(dt_wchar_t`uidt)

{-4}	∀ (x: int): range_integral(typ′)(x) ⊃ $x \geq 0$
{-5}	unsigned_integer?(typ′)
{1}	(x' ∈ range_integral(typ′))

Expanding the definition of member,
which is trivially true.
This completes the proof of `range_integral_unsigned.1.2.1`.
`range_integral_unsigned.1.2.2`:

{-1}	integer_pred(x')
{-2}	is_finite[int](range_integral(typ$'$))
{-3}	(x' ∈ range_integral(typ$'$))
{-4}	∀ (x: int): range_integral(typ$'$)(x) ⊃ $x \geq 0$
{-5}	unsigned_integer?(typ$'$)
{1}	$x' \geq 0$

Instantiating quantified variables,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of member,
which is trivially true.
This completes the proof of `range_integral_unsigned.1.2.2`.
`range_integral_unsigned.2`:

{-1}	unsigned_integer?(typ$'$)
{1}	∀ (x: int): range_integral(typ$'$)(x) ⊃ $x \geq 0$
{2}	(∀ (x: int): range_integral(typ$'$)(x) ⊃ $x \geq 0$) ∧ is_finite[nat](range_integral(typ$'$)) ∧ ¬ empty?[nat](range_integral(typ$'$))

Hiding formulas: 2,
Repeatedly Skolemizing and flattening,
Expanding the definition of unsigned_integer?,
Expanding the definition of range_integral,
Adding type constraints for range_uchar,
Adding type constraints for range_ulonglong,
Adding type constraints for range_ulong,
Adding type constraints for range_ushort,
Adding type constraints for range_uint,
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_integral_unsigned.2`.
`range_integral_unsigned.3`:

{-1}	unsigned_integer?(typ$'$)
{1}	non_bool_integral?(typ$'$)
{2}	(∀ (x: int): range_integral(typ$'$)(x) ⊃ $x \geq 0$) ∧ is_finite[nat](range_integral(typ$'$)) ∧ ¬ empty?[nat](range_integral(typ$'$))

Expanding the definition of non_bool_integral?,
which is trivially true.
This completes the proof of `range_integral_unsigned.3`.
Q.E.D.

C.43.25 Cpp_Integral_Types.max_value_TCC1

Terse proof for `max_value_TCC1`.
`max_value_TCC1`:

{1}	∀ (typ: (non_bool_integral?)): ¬ empty?[real](extend[real, int, bool, FALSE](range_integral(typ)))

Repeatedly Skolemizing and flattening,
Adding type constraints for range_integral(typ!1),
Expanding the definition of empty?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Keeping (-3 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `max_value_TCC1`.
Q.E.D.

C.43.26 Cpp_Integral_Types.max_value_TCC2

Terse proof for `max_value_TCC2`.

`max_value_TCC2:`

```
{1}  ∀ (typ: (non_bool_integral?)):
       rational_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ)))) ∧
         integer_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ))))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for max[real, <=](extend[real, int, bool, FALSE](range_integral(typ!1))),
we get 2 subgoals:

`max_value_TCC2.1:`

```
{-1}  extend[real, int, bool, FALSE]
        (range_integral(typ′))
        (max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))
{-2}  ∀ (x: real):
        extend[real, int, bool, FALSE](range_integral(typ′))(x) ⊃
          x ≤ max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))
{-3}  non_bool_integral?(typ′)
------------------------------------------------------------------------------
{1}   rational_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))) ∧
        integer_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))
```

Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `max_value_TCC2.1`.

`max_value_TCC2.2:`

```
{-1}  empty?[real](extend[real, int, bool, FALSE](range_integral(typ′)))
{-2}  non_bool_integral?(typ′)
------------------------------------------------------------------------------
{1}   rational_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))) ∧
        integer_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))
```

Using lemma max_value_TCC1,
This completes the proof of `max_value_TCC2.2`.
Q.E.D.

C.43.27 Cpp_Integral_Types.min_value_TCC1

Terse proof for `min_value_TCC1`.

`min_value_TCC1:`

{1} ∀ (typ: (non_bool_integral?)):
rational_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ)))) ∧
integer_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ))))

Repeatedly Skolemizing and flattening,
Adding type constraints for min[real, <=](extend[real, int, bool, FALSE](range_integral(typ!1))),
we get 2 subgoals:
`min_value_TCC1.1:`

{-1} extend[real, int, bool, FALSE]
(range_integral(typ′))
(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))
{-2} ∀ (x: real):
extend[real, int, bool, FALSE](range_integral(typ′))(x) ⊃
min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))) ≤ x
{-3} non_bool_integral?(typ′)

{1} rational_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))) ∧
integer_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))

Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `min_value_TCC1.1`.
`min_value_TCC1.2:`

{-1} empty?[real](extend[real, int, bool, FALSE](range_integral(typ′)))
{-2} non_bool_integral?(typ′)

{1} rational_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))) ∧
integer_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))

Using lemma max_value_TCC1,
This completes the proof of `min_value_TCC1.2`.
Q.E.D.

C.43.28 Cpp_Integral_Types.max_value_unsigned

Terse proof for `max_value_unsigned`.
`max_value_unsigned:`

{1} ∀ (typ: (unsigned_integer?)): max_value(typ) ≥ 0

Repeatedly Skolemizing and flattening,
Expanding the definition of max_value,
Using lemma range_integral_unsigned,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
we get 2 subgoals:

`max_value_unsigned.1:`

```
{-1}  range_integral(typ′)(max(extend[real, int, bool, FALSE](range_integral(typ′)))) ⊃
        max(extend[real, int, bool, FALSE](range_integral(typ′))) ≥ 0
{-2}  unsigned_integer?(typ′)
------------------------------------------------------------------------------
{1}   empty?[nat](range_integral(typ′))
{2}   max(extend[real, int, bool, FALSE](range_integral(typ′))) ≥ 0
```

Adding type constraints for max(extend[real, int, bool, FALSE](range_integral(typ!1))),
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `max_value_unsigned.1`.

`max_value_unsigned.2:`

```
{-1}  unsigned_integer?(typ′)
------------------------------------------------------------------------------
{1}   rational_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))) ∧
        integer_pred(max[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))
{2}   empty?[nat](range_integral(typ′))
{3}   max(extend[real, int, bool, FALSE](range_integral(typ′))) ≥ 0
```

Using lemma max_value_TCC2,
This completes the proof of `max_value_unsigned.2`.
Q.E.D.

C.43.29 Cpp_Integral_Types.min_value_unsigned

Terse proof for `min_value_unsigned`.

`min_value_unsigned:`

```
------------------------------------------------------------------------------
{1}   ∀ (typ: (unsigned_integer?)): min_value(typ) ≥ 0
```

Expanding the definition of min_value,
Repeatedly Skolemizing and flattening,
Using lemma range_integral_unsigned,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
we get 2 subgoals:

`min_value_unsigned.1:`

```
{-1}  range_integral(typ′)(min(extend[real, int, bool, FALSE](range_integral(typ′)))) ⊃
        min(extend[real, int, bool, FALSE](range_integral(typ′))) ≥ 0
{-2}  unsigned_integer?(typ′)
------------------------------------------------------------------------------
{1}   empty?[nat](range_integral(typ′))
{2}   min(extend[real, int, bool, FALSE](range_integral(typ′))) ≥ 0
```

Adding type constraints for min(extend[real, int, bool, FALSE](range_integral(typ!1))),
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `min_value_unsigned.1`.

`min_value_unsigned.2:`

{-1} unsigned_integer?(typ′)

{1} rational_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′)))) ∧
integer_pred(min[real, ≤](extend[real, int, bool, FALSE](range_integral(typ′))))
{2} empty?[nat](range_integral(typ′))
{3} min(extend[real, int, bool, FALSE](range_integral(typ′))) ≥ 0

Using lemma min_value_TCC1,
This completes the proof of `min_value_unsigned.2`.
Q.E.D.

C.43.30 Cpp_Integral_Types.max_value_bits_TCC1

Terse proof for `max_value_bits_TCC1`.
`max_value_bits_TCC1:`

{1} well_founded?(λ (x: (cv(unsigned_integer?)), y: (cv(unsigned_integer?))):
restrict
[[Cpp_Type_, Cpp_Type_],
[(cv(unsigned_integer?)), (cv(unsigned_integer?))], boolean]
(≪)(x, y))

Using lemma well_founded_restrict[Cpp_Type_, (cv(unsigned_integer?))],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of `max_value_bits_TCC1`.
Q.E.D.

C.43.31 Cpp_Integral_Types.max_value_bits_TCC2

Terse proof for `max_value_bits_TCC2`.
`max_value_bits_TCC2:`

{1} ∀ (typ: (cv(unsigned_integer?)), t: Cpp_Type_):
typ = const(t) ⊃ cv(unsigned_integer?)(t)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `max_value_bits_TCC2`.
Q.E.D.

C.43.32 Cpp_Integral_Types.max_value_bits_TCC3

Terse proof for `max_value_bits_TCC3`.
`max_value_bits_TCC3:`

{1} ∀ (typ: (cv(unsigned_integer?)), t: Cpp_Type_):
typ = const(t) ⊃
restrict
[[Cpp_Type_, Cpp_Type_], [(cv(unsigned_integer?)), (cv(unsigned_integer?))],
boolean]
(≪)(t, typ)

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `max_value_bits_TCC3`.

Q.E.D.

C.43.33 Cpp_Integral_Types.max_value_bits_TCC4

Terse proof for `max_value_bits_TCC4`.

`max_value_bits_TCC4:`

```
{1}   ∀ (typ: (cv(unsigned_integer?)), t: Cpp_Type_):
        typ = volatile(t) ⊃ cv(unsigned_integer?)(t)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `max_value_bits_TCC4`.

Q.E.D.

C.43.34 Cpp_Integral_Types.max_value_bits_TCC5

Terse proof for `max_value_bits_TCC5`.

`max_value_bits_TCC5:`

```
{1}   ∀ (typ: (cv(unsigned_integer?)), t: Cpp_Type_):
        typ = volatile(t) ⊃
         restrict
              [[Cpp_Type_, Cpp_Type_], [(cv(unsigned_integer?)), (cv(unsigned_integer?))],
                boolean]
              (≪)(t, typ)
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `max_value_bits_TCC5`.

Q.E.D.

C.43.35 Cpp_Integral_Types.max_value_bits_TCC6

Terse proof for `max_value_bits_TCC6`.

`max_value_bits_TCC6:`

{1} ∀ (typ: (cv(unsigned_integer?))):
¬ (schar?(typ) ∨
char?(typ) ∨
short?(typ) ∨
int?(typ) ∨
long?(typ) ∨
longlong?(typ) ∨
wchar_t?(typ) ∨
bool?(typ) ∨
float?(typ) ∨
double?(typ) ∨
longdouble?(typ) ∨
void?(typ) ∨
array?(typ) ∨
function?(typ) ∨
pointer?(typ) ∨
reference?(typ) ∨
class?(typ) ∨
union?(typ) ∨
bitfield?(typ) ∨ enum?(typ) ∨ pointer_to_member?(typ))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `max_value_bits_TCC6`.
Q.E.D.

C.44 Proofs for Cpp_Types (types.pvs)

C.44.1 Cpp_Types.alignment_TCC1

Terse proof for `alignment_TCC1`.
`alignment_TCC1:`

{1} well_founded?(λ (x: Cpp_Type, y: Cpp_Type):
restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean]
(≪)(x, y))

Using lemma well_founded_restrict[Cpp_Type_, Cpp_Type],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of `alignment_TCC1`.
Q.E.D.

C.44.2 Cpp_Types.alignment_TCC2

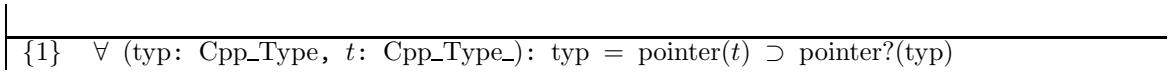
Terse proof for `alignment_TCC2`.
`alignment_TCC2:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_, s: nat): typ = array_type(t, s) ⊃ array?(typ)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC2`.
Q.E.D.

C.44.3 Cpp_Types.alignment_TCC3

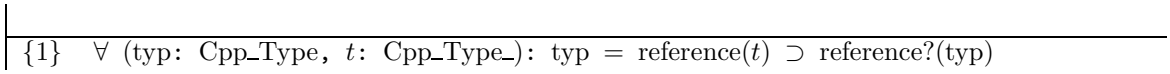
Terse proof for `alignment_TCC3`.
`alignment_TCC3`:



Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC3`.
Q.E.D.

C.44.4 Cpp_Types.alignment_TCC4

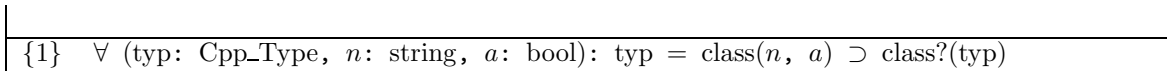
Terse proof for `alignment_TCC4`.
`alignment_TCC4`:



Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC4`.
Q.E.D.

C.44.5 Cpp_Types.alignment_TCC5

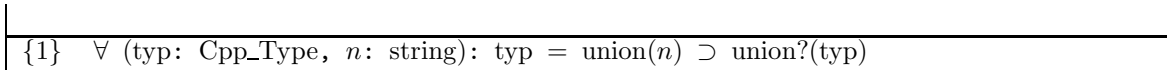
Terse proof for `alignment_TCC5`.
`alignment_TCC5`:



Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC5`.
Q.E.D.

C.44.6 Cpp_Types.alignment_TCC6

Terse proof for `alignment_TCC6`.
`alignment_TCC6`:



Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC6`.
Q.E.D.

C.44.7 Cpp_Types.alignment_TCC7

Terse proof for `alignment_TCC7`.
`alignment_TCC7`:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_, bo: nat, s: posnat):
typ = bitfield(t, bo, s) ⊃ bitfield?(typ)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC7`.
Q.E.D.

C.44.8 Cpp_Types.alignment_TCC8

Terse proof for `alignment_TCC8`.
`alignment_TCC8`:

{1} ∀ (typ: Cpp_Type, n: string, t: Cpp_Type_, m: posnat, c: [below[m] → int]):
typ = enum(n, t, m, c) ⊃ enum?(typ)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC8`.
Q.E.D.

C.44.9 Cpp_Types.alignment_TCC9

Terse proof for `alignment_TCC9`.
`alignment_TCC9`:

{1} ∀ (typ: Cpp_Type, t: (class?), m: Cpp_Type_):
typ = pointer_to_member(t, m) ⊃ pointer_to_member?(typ)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC9`.
Q.E.D.

C.44.10 Cpp_Types.alignment_TCC10

Terse proof for `alignment_TCC10`.
`alignment_TCC10`:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_): typ = const(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC10`.
Q.E.D.

C.44.11 Cpp_Types.alignment_TCC11

Terse proof for `alignment_TCC11`.

`alignment_TCC11`:

```
{1}  ∀ (typ: Cpp_Type, t: Cpp_Type_):
       typ = const(t) ⊃
         restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean](≪)(t, typ)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of restrict,
Replacing using formula -2,
Expanding the definition of ■,
which is trivially true.
This completes the proof of `alignment_TCC11`.
Q.E.D.

C.44.12 Cpp_Types.alignment_TCC12

Terse proof for `alignment_TCC12`.

`alignment_TCC12`:

```
{1}  ∀ (typ: Cpp_Type, t: Cpp_Type_): typ = volatile(t) ⊃ Cpp_Type?(t)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -1 with the terms: (t!2),
Expanding the definition of subterm,
Replacing using formula -2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `alignment_TCC12`.
Q.E.D.

C.44.13 Cpp_Types.alignment_TCC13

Terse proof for `alignment_TCC13`.

`alignment_TCC13`:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = volatile(t) ⊃
restrict[[Cpp_Type_, Cpp_Type_], [Cpp_Type, Cpp_Type], boolean](≪)(t, typ)

Repeatedly Skolemizing and flattening,
Expanding the definition of restrict,
Replacing using formula -2,
Expanding the definition of ■,
which is trivially true.
This completes the proof of `alignment_TCC13`.
Q.E.D.

C.44.14 Cpp_Types.pointer_to_aligned_object_TCC1

Terse proof for `pointer_to_aligned_object_TCC1`.

`pointer_to_aligned_object_TCC1`:

{1} ∀ (p: Cpp_Subtype(cv(pointer?)), ptr_val: (range_pointer(cv_base(p)))):
not_null?(p)(ptr_val) ⊃
array?(cv_base(p)) ∨
pointer?(cv_base(p)) ∨
reference?(cv_base(p)) ∨
bitfield?(cv_base(p)) ∨
enum?(cv_base(p)) ∨
pointer_to_member?(cv_base(p)) ∨ const?(cv_base(p)) ∨ volatile?(cv_base(p))

Repeatedly Skolemizing and flattening,
Keeping (-2 2) and hiding *,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pointer_to_aligned_object_TCC1`.
Q.E.D.

C.44.15 Cpp_Types.pointer_to_aligned_object_TCC2

Terse proof for `pointer_to_aligned_object_TCC2`.

`pointer_to_aligned_object_TCC2`:

{1} ∀ (p: Cpp_Subtype(cv(pointer?)), ptr_val: (range_pointer(cv_base(p)))):
not_null?(p)(ptr_val) ⊃ Cpp_Type?(typ(cv_base(p)))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -1 with the terms: (t!1),
Splitting conjunctions,
we get 2 subgoals:

`pointer_to_aligned_object_TCC2.1:`

{-1} $\text{no\_pointers\_to\_bitfield?}(t') \wedge \text{no\_pointers\_to\_references?}(t') \wedge \text{no\_cv\_references?}(t') \wedge \text{no\_reference\_to\_reference?}(t') \wedge \text{no\_reference\_to\_bitfields?}(t') \wedge \text{no\_pointer\_to\_member\_to\_reference?}(t') \wedge \text{no\_pointer\_to\_member\_to\_cv\_void?}(t') \wedge \text{no\_cv\_void\_parameter?}(t') \wedge \text{no\_array\_of\_references?}(t') \wedge \text{no\_array\_of\_cv\_void?}(t') \wedge \text{no\_array\_of\_function?}(t') \wedge \text{no\_array\_of\_abstract\_class?}(t') \wedge \text{no\_pointer\_or\_ref\_to\_incomplete\_array\_parameter?}(t') \wedge \text{no\_array\_return\_type?}(t') \wedge \text{no\_function\_return\_type?}(t') \wedge \text{bitfield\_underlying\_integral\_or\_enum\_type?}(t') \wedge \text{cv\_array?}(t') \wedge \text{enum\_underlying\_integral?}(t') \wedge \text{enum\_constants?}(t') \wedge \text{const\_volatile?}(t') \wedge \text{const\_stutter?}(t') \wedge \text{volatile\_stutter?}(t') \wedge \text{no\_cv\_class?}(t') \wedge \text{no\_cv\_union?}(t') \wedge \text{no\_cv\_function?}(t') \wedge \text{no\_reference\_to\_void?}(t') \wedge \text{no\_cv\_void?}(t') \wedge \text{no\_array\_of\_bitfields?}(t')$

{-2} $\text{cv(pointer?)}(p')$

{-3} $\text{range\_pointer}(\text{cv\_base}(p'))(\text{ptr\_val}')$

{-4} $\text{not\_null?}(p')(\text{ptr\_val}')$

{-5} $\text{subterm}(t', \text{typ}(\text{cv\_base}(p')))$

{1} $\text{no\_pointers\_to\_bitfield?}(t') \wedge \text{no\_pointers\_to\_references?}(t') \wedge \text{no\_cv\_references?}(t') \wedge \text{no\_reference\_to\_reference?}(t') \wedge \text{no\_reference\_to\_bitfields?}(t') \wedge \text{no\_pointer\_to\_member\_to\_reference?}(t') \wedge \text{no\_pointer\_to\_member\_to\_cv\_void?}(t') \wedge \text{no\_cv\_void\_parameter?}(t') \wedge \text{no\_array\_of\_references?}(t') \wedge \text{no\_array\_of\_cv\_void?}(t') \wedge \text{no\_array\_of\_function?}(t') \wedge \text{no\_array\_of\_abstract\_class?}(t') \wedge \text{no\_pointer\_or\_ref\_to\_incomplete\_array\_parameter?}(t') \wedge \text{no\_array\_return\_type?}(t') \wedge \text{no\_function\_return\_type?}(t') \wedge \text{bitfield\_underlying\_integral\_or\_enum\_type?}(t') \wedge \text{cv\_array?}(t') \wedge \text{enum\_underlying\_integral?}(t') \wedge \text{enum\_constants?}(t') \wedge \text{const\_volatile?}(t') \wedge \text{const\_stutter?}(t') \wedge \text{volatile\_stutter?}(t') \wedge \text{no\_cv\_class?}(t') \wedge \text{no\_cv\_union?}(t') \wedge \text{no\_cv\_function?}(t') \wedge \text{no\_reference\_to\_void?}(t') \wedge \text{no\_cv\_void?}(t') \wedge \text{no\_array\_of\_bitfields?}(t')$

which is trivially true.
This completes the proof of `pointer_to_aligned_object_TCC2.1`.
`pointer_to_aligned_object_TCC2.2`:

{-1} cv(pointer?)(p')
{-2} range_pointer(cv_base(p'))(ptr_val$'$)
{-3} not_null?(p')(ptr_val$'$)
{-4} subterm(t', typ(cv_base(p')))

{1} subterm(t', p')
{2} no_pointers_to_bitfield?(t') ∧
no_pointers_to_references?(t') ∧
no_cv_references?(t') ∧
no_reference_to_reference?(t') ∧
no_reference_to_bitfields?(t') ∧
no_pointer_to_member_to_reference?(t') ∧
no_pointer_to_member_to_cv_void?(t') ∧
no_cv_void_parameter?(t') ∧
no_array_of_references?(t') ∧
no_array_of_cv_void?(t') ∧
no_array_of_function?(t') ∧
no_array_of_abstract_class?(t') ∧
no_pointer_or_ref_to_incomplete_array_parameter?(t') ∧
no_array_return_type?(t') ∧
no_function_return_type?(t') ∧
bitfield_underlying_integral_or_enum_type?(t') ∧
cv_array?(t') ∧
enum_underlying_integral?(t') ∧
enum_constants?(t') ∧
const_volatile?(t') ∧
const_stutter?(t') ∧
volatile_stutter?(t') ∧
no_cv_class?(t') ∧
no_cv_union?(t') ∧
no_cv_function?(t') ∧
no_reference_to_void?(t') ∧
no_cv_void?(t') ∧ no_array_of_bitfields?(t')

Hiding formulas: 2,
Using lemma subterm_cv_base,
Using lemma subterm_transitive,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Using lemma cv_base_result,
we get 2 subgoals:
`pointer_to_aligned_object_TCC2.2.1`:

{-1} pointer?(cv_base(p'))
{-2} subterm(cv_base(p'), p')
{-3} cv(pointer?)(p')
{-4} range_pointer(cv_base(p'))(ptr_val$'$)
{-5} not_null?(p')(ptr_val$'$)
{-6} subterm(t', typ(cv_base(p')))

{1} subterm(t', cv_base(p'))
{2} subterm(t', p')

Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pointer_to_aligned_object_TCC2.2.1`.
`pointer_to_aligned_object_TCC2.2.2`:

```
{-1}  subterm(cv_base(p'), p')
{-2}  cv(pointer?)(p')
{-3}  range_pointer(cv_base(p'))(ptr_val')
{-4}  not_null?(p')(ptr_val')
{-5}  subterm(t', typ(cv_base(p')))
------------------------------------------------------------
{1}   (pointer? ⊆ interpreted?)
{2}   subterm(t', cv_base(p'))
{3}   subterm(t', p')
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pointer_to_aligned_object_TCC2.2.2`.
Q.E.D.

C.44.16 Cpp_Types.pointer_to_aligned_object_TCC3

Terse proof for `pointer_to_aligned_object_TCC3`.
`pointer_to_aligned_object_TCC3`:

```
------------------------------------------------------------
{1}   ∀ (p: Cpp_Subtype(cv(pointer?)), ptr_val: (range_pointer(cv_base(p)))):
        not_null?(p)(ptr_val) ⊃ up?[Memory_Address](address_of(p)(ptr_val))
```

Repeatedly Skolemizing and flattening,
Rewriting using address_of_spec, matching in *,
This completes the proof of `pointer_to_aligned_object_TCC3`.
Q.E.D.

C.44.17 Cpp_Types.align_array_of_type_TCC1

Terse proof for `align_array_of_type_TCC1`.
`align_array_of_type_TCC1`:

```
------------------------------------------------------------
{1}   ∀ (a: Cpp_Subtype(array?)):
        array?(a) ∨
          pointer?(a) ∨
            reference?(a) ∨
              bitfield?(a) ∨ enum?(a) ∨ pointer_to_member?(a) ∨ const?(a) ∨ volatile?(a)
```

Repeatedly Skolemizing and flattening,
This completes the proof of `align_array_of_type_TCC1`.
Q.E.D.

C.44.18 Cpp_Types.align_array_of_type_TCC2

Terse proof for `align_array_of_type_TCC2`.

`align_array_of_type_TCC2`:

{1} ∀ (a: Cpp_Subtype(array?)): Cpp_Type?(typ(a))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -1 with the terms: (t!1),
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `align_array_of_type_TCC2`.
Q.E.D.

C.44.19 Cpp_Types.range_TCC1

Terse proof for `range_TCC1`.

`range_TCC1`:

{1} well_founded?(λ (x: Cpp_Subtype(cv(non_bool_integral_enum?)),
y: Cpp_Subtype(cv(non_bool_integral_enum?))):
restrict
[[Cpp_Type_, Cpp_Type_],
[Cpp_Subtype(cv(non_bool_integral_enum?)),
Cpp_Subtype(cv(non_bool_integral_enum?))],
boolean]
(≪)(x, y))

Using lemma well_founded_restrict[Cpp_Type_, Cpp_Subtype(cv(non_bool_integral_enum?))],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of `range_TCC1`.
Q.E.D.

C.44.20 Cpp_Types.range_TCC2

Terse proof for `range_TCC2`.

`range_TCC2`:

{1} ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?)), n: string, t: Cpp_Type_, m: posnat,
c: [below[m] → int]):
typ = enum(n, t, m, c) ⊃ enum?(typ)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_TCC2`.
Q.E.D.

C.44.21 Cpp_Types.range_TCC3

Terse proof for `range_TCC3`.

`range_TCC3:`

```
|-------
{1}  ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?)), t: Cpp_Type_):
       typ = const(t) ⊃ Cpp_Type?(t) ∧ cv(non_bool_integral_enum?)(t)
```

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
`range_TCC3.1:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(non_bool_integral_enum?)(typ′)
{-3}  typ′ = const(t′)
|-------
{1}   Cpp_Type?(t′)
```

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Replacing using formula -4,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_TCC3.1`.
`range_TCC3.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(non_bool_integral_enum?)(typ′)
{-3}  typ′ = const(t′)
|-------
{1}   cv(non_bool_integral_enum?)(t′)
```

Replacing using formula -3,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_TCC3.2`.
Q.E.D.

C.44.22 Cpp_Types.range_TCC4

Terse proof for `range_TCC4`.
`range_TCC4:`

```
|-------
{1}  ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?)), t: Cpp_Type_):
       typ = const(t) ⊃
        restrict
             [[Cpp_Type_, Cpp_Type_],
               [Cpp_Subtype(cv(non_bool_integral_enum?)),
                 Cpp_Subtype(cv(non_bool_integral_enum?))],
               boolean]
             (≪)(t, typ)
```

Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of ■,
which is trivially true.
This completes the proof of `range_TCC4`.

Q.E.D.

C.44.23 Cpp_Types.range_TCC5

Terse proof for `range_TCC5`.

`range_TCC5:`

{1} ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?)), t: Cpp_Type_):
typ = volatile(t) ⊃ Cpp_Type?(t) ∧ cv(non_bool_integral_enum?)(t)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:

`range_TCC5.1:`

{-1} Cpp_Type?(typ′)
{-2} cv(non_bool_integral_enum?)(typ′)
{-3} typ′ = volatile(t')

{1} Cpp_Type?(t')

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Replacing using formula -4,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_TCC5.1`.

`range_TCC5.2:`

{-1} Cpp_Type?(typ′)
{-2} cv(non_bool_integral_enum?)(typ′)
{-3} typ′ = volatile(t')

{1} cv(non_bool_integral_enum?)(t')

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_TCC5.2`.
Q.E.D.

C.44.24 Cpp_Types.range_TCC6

Terse proof for `range_TCC6`.

`range_TCC6:`

{1} ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?)), t: Cpp_Type_):
typ = volatile(t) ⊃
restrict
[[Cpp_Type_, Cpp_Type_],
[Cpp_Subtype(cv(non_bool_integral_enum?)),
Cpp_Subtype(cv(non_bool_integral_enum?))],
boolean]
(≪)(t, typ)

Repeatedly Skolemizing and flattening,

Replacing using formula -3,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_TCC6`.
Q.E.D.

C.44.25 Cpp_Types.range_TCC7

Terse proof for `range_TCC7`.
`range_TCC7:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
       ¬ volatile?(typ) ∧ ¬ const?(typ) ∧ ¬ enum?(typ) ⊃ non_bool_integral?(typ)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of cv,
Expanding the definition of v,
Expanding the definition of c,
Expanding the definition of non_bool_integral_enum?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `range_TCC7`.
Q.E.D.

C.44.26 Cpp_Types.range_cv_base_TCC1

Terse proof for `range_cv_base_TCC1`.
`range_cv_base_TCC1:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
       cv(non_bool_integral_enum?)(cv_base(typ))
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Expanding the definition of cv,
Expanding the definition of c,
Applying disjunctive simplification to flatten sequent,
Expanding the definition of v,
Hiding formulas: (2 3 4),
Applying propositional simplification,
we get 5 subgoals:
`range_cv_base_TCC1.1:`

```
{-1}  non_bool_integral_enum?(typ′)
{1}   non_bool_integral_enum?(cv_base(typ′))
```

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`range_cv_base_TCC1.1.1:`

```
{-1}  non_bool_integral_enum?(typ′)
{-2}  const?(typ′)
{1}   non_bool_integral_enum?(cv_base(typ(typ′)))
```

Hiding formulas: 1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.1.1`.
`range_cv_base_TCC1.1.2:`

```
{-1}  non_bool_integral_enum?(typ')
{-2}  volatile?(typ')
------------------------------------------------------------
{1}   non_bool_integral_enum?(cv_base(typ(typ')))
```

Hiding formulas: 1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.1.2`.
`range_cv_base_TCC1.2:`

```
{-1}  const?(typ')
{-2}  non_bool_integral_enum?(typ(typ'))
------------------------------------------------------------
{1}   non_bool_integral_enum?(cv_base(typ'))
```

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`range_cv_base_TCC1.2.1:`

```
{-1}  const?(typ')
{-2}  non_bool_integral_enum?(typ(typ'))
{-3}  const?(typ(typ'))
------------------------------------------------------------
{1}   non_bool_integral_enum?(cv_base(typ(typ(typ'))))
```

Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.2.1`.
`range_cv_base_TCC1.2.2:`

```
{-1}  const?(typ')
{-2}  non_bool_integral_enum?(typ(typ'))
{-3}  volatile?(typ(typ'))
------------------------------------------------------------
{1}   non_bool_integral_enum?(cv_base(typ(typ(typ'))))
```

Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.2.2`.
`range_cv_base_TCC1.3:`

```
{-1}  non_bool_integral_enum?(typ')
------------------------------------------------------------
{1}   non_bool_integral_enum?(cv_base(typ'))
```

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`range_cv_base_TCC1.3.1:`

```
{-1}  non_bool_integral_enum?(typ')
{-2}  const?(typ')
------------------------------------------------------------
{1}   non_bool_integral_enum?(cv_base(typ(typ')))
```

Keeping (-2 -1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.3.1`.
`range_cv_base_TCC1.3.2`:

{-1}	non_bool_integral_enum?(typ′)
{-2}	volatile?(typ′)
{1}	non_bool_integral_enum?(cv_base(typ(typ′)))

Keeping (-2 -1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.3.2`.
`range_cv_base_TCC1.4`:

{-1}	volatile?(typ′)
{-2}	non_bool_integral_enum?(typ(typ′))
{1}	non_bool_integral_enum?(cv_base(typ′))

Expanding the definition of cv_base,
Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`range_cv_base_TCC1.4.1`:

{-1}	volatile?(typ′)
{-2}	non_bool_integral_enum?(typ(typ′))
{-3}	const?(typ(typ′))
{1}	non_bool_integral_enum?(cv_base(typ(typ(typ′))))

Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.4.1`.
`range_cv_base_TCC1.4.2`:

{-1}	volatile?(typ′)
{-2}	non_bool_integral_enum?(typ(typ′))
{-3}	volatile?(typ(typ′))
{1}	non_bool_integral_enum?(cv_base(typ(typ(typ′))))

Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.4.2`.
`range_cv_base_TCC1.5`:

{-1}	const?(typ′)
{-2}	volatile?(typ(typ′))
{-3}	non_bool_integral_enum?(typ(typ(typ′)))
{1}	non_bool_integral_enum?(cv_base(typ′))

Expanding the definition of cv_base,
Expanding the definition of cv_base,
Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

`range_cv_base_TCC1.5.1:`

{-1}	const?(typ′)
{-2}	volatile?(typ(typ′))
{-3}	non_bool_integral_enum?(typ(typ(typ′)))
{-4}	const?(typ(typ(typ′)))
{1}	non_bool_integral_enum?(cv_base(typ(typ′)))

Keeping (-4 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.5.1`.
`range_cv_base_TCC1.5.2:`

{-1}	const?(typ′)
{-2}	volatile?(typ(typ′))
{-3}	non_bool_integral_enum?(typ(typ(typ′)))
{-4}	volatile?(typ(typ(typ′)))
{1}	non_bool_integral_enum?(cv_base(typ(typ(typ(typ′)))))

Keeping (-4 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base_TCC1.5.2`.
Q.E.D.

C.44.27 Cpp_Types.range_cv_base

Terse proof for `range_cv_base`.
`range_cv_base:`

{1}	∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?))): range(typ) = range(cv_base(typ))

Repeatedly Skolemizing and flattening,
Expanding the definition of cv,
Expanding the definition of c,
Expanding the definition of v,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 4 subgoals:
`range_cv_base.1:`

{-1}	Cpp_Type?(typ′)
{-2}	non_bool_integral_enum?(typ′)
{1}	range(typ′) = range(cv_base(typ′))

Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`range_cv_base.1.1:`

{-1}	Cpp_Type?(typ′)
{-2}	non_bool_integral_enum?(typ′)
{-3}	const?(typ′)
{1}	range(typ′) = range(cv_base(typ(typ′)))

Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `range_cv_base.1.1`.
`range_cv_base.1.2:`

{-1}	Cpp_Type?(typ′)
{-2}	non_bool_integral_enum?(typ′)
{-3}	volatile?(typ′)
{1}	range(typ′) = range(cv_base(typ(typ′)))

Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base.1.2`.
`range_cv_base.2:`

{-1}	Cpp_Type?(typ′)
{-2}	const?(typ′)
{-3}	non_bool_integral_enum?(typ(typ′))
{1}	range(typ′) = range(cv_base(typ′))

Expanding the definition of cv_base,
Expanding the definition of range,
Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`range_cv_base.2.1:`

{-1}	Cpp_Type?(typ′)
{-2}	const?(typ′)
{-3}	non_bool_integral_enum?(typ(typ′))

{1}	range(typ(typ′)) = range(cv_base(typ(typ(typ′))))

Keeping (-3 -4) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base.2.2`.
`range_cv_base.3:`

{-1}	Cpp_Type?(typ′)
{-2}	const?(typ′)
{-3}	volatile?(typ(typ′))
{-4}	non_bool_integral_enum?(typ(typ(typ′)))
{1}	range(typ′) = range(cv_base(typ′))

Expanding the definition of cv_base,
Expanding the definition of cv_base,
Expanding the definition of range,
Expanding the definition of range,

Expanding the definition of cv_base,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`range_cv_base.3.1:`

```
{-1}  Cpp_Type?(typ')
{-2}  const?(typ')
{-3}  volatile?(typ(typ'))
{-4}  non_bool_integral_enum?(typ(typ(typ')))
{-5}  const?(typ(typ(typ')))
------------------------------------------------------------------------
{1}   range(typ(typ(typ'))) = range(cv_base(typ(typ(typ(typ')))))
```

Keeping (-4 -5) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `range_cv_base.3.1`.

`range_cv_base.3.2:`

```
{-1}  Cpp_Type?(typ')
{-2}  const?(typ')
{-3}  volatile?(typ(typ'))
{-4}  non_bool_integral_enum?(typ(typ(typ')))
{-5}  volatile?(typ(typ(typ')))
------------------------------------------------------------------------
{1}   range(typ(typ(typ'))) = range(cv_base(typ(typ(typ(typ')))))
```

Keeping (-4 -5) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `range_cv_base.3.2`.

`range_cv_base.4:`

```
{-1}  Cpp_Type?(typ')
{-2}  non_bool_integral_enum?(typ(typ'))
{-3}  volatile?(typ')
------------------------------------------------------------------------
{1}   range(typ') = range(cv_base(typ'))
```

Expanding the definition of cv_base,

Expanding the definition of cv_base,

Expanding the definition of range,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`range_cv_base.4.1:`

```
{-1}  Cpp_Type?(typ')
{-2}  non_bool_integral_enum?(typ(typ'))
{-3}  volatile?(typ')
{-4}  const?(typ(typ'))
------------------------------------------------------------------------
{1}   range(typ(typ')) = range(cv_base(typ(typ(typ'))))
```

Keeping (-2 -4) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `range_cv_base.4.1`.

`range_cv_base.4.2:`

{-1}	Cpp_Type?(typ′)

{-3}	volatile?(typ′)
{-4}	volatile?(typ(typ′))
{1}	range(typ(typ′)) = range(cv_base(typ(typ(typ′))))

Keeping (-2 -4) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `range_cv_base.4.2`.
Q.E.D.

C.44.28 Cpp_Types.dt_non_bool_integral_enum_TCC1

Terse proof for `dt_non_bool_integral_enum_TCC1`.

`dt_non_bool_integral_enum_TCC1:`

{1}	∀ (typ: Cpp_Subtype(non_bool_integral_enum?), n: string, t: Cpp_Type_, m: posnat, c: [below[m] → int]): typ = enum(n, t, m, c) ⊃ enum?(typ)

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_non_bool_integral_enum_TCC1`.
Q.E.D.

C.44.29 Cpp_Types.dt_non_bool_integral_enum_TCC2

Terse proof for `dt_non_bool_integral_enum_TCC2`.

`dt_non_bool_integral_enum_TCC2:`

{1}	∀ (typ: Cpp_Subtype(non_bool_integral_enum?), n: string, t: Cpp_Type_, m: posnat, c: [below[m] → int]): typ = enum(n, t, m, c) ⊃ (∀ (x: int): range_enum(typ)(x) ≡ range(typ)(x)) ∧ (∀ (x: int): range_enum(typ)(x) ≡ range(typ)(x)) ∧ (∀ (x_1: [list[Byte], Address]): every[((range_enum(typ)))]((range(typ)))(dt_enum(typ)‘from_byte(x_1))) ∧ interpreted_data_type?[(range(typ))](dt_enum(typ))

Repeatedly Skolemizing and flattening,
Replacing using formula -4,
Expanding the definition of range,
Adding type constraints for dt_enum(enum(n!1, t!1, m!1, c!1)),
we get 2 subgoals:

`dt_non_bool_integral_enum_TCC2.1:`

```
{-1}  pod_data_type?[((range_enum(enum(n', t', m', c'))))]
          (dt_enum(enum(n', t', m', c')))
{-2}  Cpp_Type?(enum(n', t', m', c'))
{-3}  non_bool_integral_enum?(enum(n', t', m', c'))
{-4}  m' > 0
{-5}  typ' = enum(n', t', m', c')
------------------------------------------------------------------------
{1}   (∀ (x1: [list[Byte], Address]):
          every[((range_enum(typ')))]
              (range_enum(enum(n', t', m', c')))
              (dt_enum(enum(n', t', m', c'))`from_byte(x1)))
       ∧ interpreted_data_type?[((range(typ')))](dt_enum(enum(n', t', m', c')))
```

Applying propositional simplification,

we get 2 subgoals:

`dt_non_bool_integral_enum_TCC2.1.1:`

```
{-1}  pod_data_type?[((range_enum(enum(n', t', m', c'))))]
          (dt_enum(enum(n', t', m', c')))
{-2}  Cpp_Type?(enum(n', t', m', c'))
{-3}  non_bool_integral_enum?(enum(n', t', m', c'))
{-4}  m' > 0
{-5}  typ' = enum(n', t', m', c')
------------------------------------------------------------------------
{1}   ∀ (x1: [list[Byte], Address]):
        every[((range_enum(typ')))]
            (range_enum(enum(n', t', m', c')))
            (dt_enum(enum(n', t', m', c'))`from_byte(x1))
```

Repeatedly Skolemizing and flattening,

Expanding the definition of every,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_non_bool_integral_enum_TCC2.1.1`.

`dt_non_bool_integral_enum_TCC2.1.2:`

```
{-1}  pod_data_type?[((range_enum(enum(n', t', m', c'))))]
          (dt_enum(enum(n', t', m', c')))

                                  [Cpp_Subtype(cv(non_bool_integral_enum?)),
                                    Cpp_Subtype(cv(non_bool_integral_enum?))],
                                  boolean]
                                (≪)(z, typ)} →
                    (interpreted_data_type?[((range(typ1)))])],
            t: Cpp_Type_):
       typ = const(t) ⊃
        (∀ (x: int): range(t)(x) ≡ range(typ)(x)) ∧
         (∀ (x: int): range(t)(x) ≡ range(typ)(x)) ∧
          (∀ (x1: [list[Byte], Address]):
              every[((range(t)))]
                  ((range(typ)))(dt_const[((range(t)))](v(t))‘from_byte(x1)))
           ∧ interpreted_data_type?[(range(typ))](dt_const[((range(t)))](v(t)))
```

Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of range,
Applying propositional simplification,
we get 2 subgoals:
dt_TCC2.1:

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(non_bool_integral_enum?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------
{1}   ∀ (x1: [list[Byte], Address]):
        every[((range(t')))]
            ((range(const(t'))))
            (dt_const[((range(t')))](v'(t'))‘from_byte(x1))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of range,
which is trivially true.
This completes the proof of dt_TCC2.1.

`dt_TCC2.2:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(non_bool_integral_enum?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range(typ')))](dt_const[((range(t')))](v'(t')))
```

Adding type constraints for dt_const(v!1(t!1)),

we get 2 subgoals:

`dt_TCC2.2.1:`

```
{-1}  interpreted_data_type?[((range(t')))](dt_const(v'(t')))

        valid?(uidt(dt_volatile(v'(t'))))(l, a) ≡
          up?(from_byte(dt_volatile(v'(t')))(l, a))
{-4}  ∀ (d: ((range(t'))), a: Address):
        down(from_byte(dt_volatile(v'(t')))
                      (to_byte(dt_volatile(v'(t')))(d, a), a))
          = d
{-5}  Cpp_Type?(volatile(t'))
{-6}  cv(non_bool_integral_enum?)(volatile(t'))
{-7}  typ' = volatile(t')
-------------------------------------------------------------------------------
{1}   ∀ (d: ((range(typ'))), a: Address):
        down(from_byte(dt_volatile[((range(t')))](v'(t')))
                      (to_byte(dt_volatile[((range(t')))](v'(t')))(d, a), a))
          = d
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Replacing using formula -7,
Expanding the definition of range,
which is trivially true.
This completes the proof of dt_TCC4.2.1.2.
dt_TCC4.2.2:

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(non_bool_integral_enum?)(volatile(t'))
{-3}  typ' = volatile(t')
-------------------------------------------------------------------------------
{1}   ∃ (x1: (interpreted_data_type?[((range(t')))])): TRUE
{2}   interpreted_data_type?[((range(typ')))]
          (dt_volatile[((range(t')))](v'(t')))
```

Using lemma dt_TCC3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_TCC4.2.2.
Q.E.D.

C.44.37 Cpp_Types.dt_TCC5

Terse proof for dt_TCC5.
dt_TCC5:

```
-------------------------------------------------------------------------------
{1}   ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
        ¬ volatile?(typ) ∧ ¬ const?(typ) ⊃ non_bool_integral_enum?(typ)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of dt_TCC5.
Q.E.D.

C.44.38 Cpp_Types.dt_pod

Terse proof for dt_pod.

`dt_pod:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
       pod_data_type?[(range(typ))](dt(typ))
```

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: cv c v
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 4 subgoals:
`dt_pod.1:`

```
{-1}  Cpp_Type?(typ′)
{-2}  non_bool_integral_enum?(typ′)
{1}   pod_data_type?[((range(typ′)))](dt(typ′))
```

Expanding the definition of dt,
Adding type constraints for dt_non_bool_integral_enum(typ!1),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`dt_pod.1.1:`

```
{-1}  pod_data_type?[((range(typ′)))](dt_non_bool_integral_enum(typ′))
{-2}  Cpp_Type?(typ′)
{-3}  non_bool_integral_enum?(typ′)
{-4}  const?(typ′)
{1}   pod_data_type?[((range(typ′)))](dt_const(dt(typ(typ′))))
```

Keeping (-3 -4) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_pod.1.1`.
`dt_pod.1.2:`

```
{-1}  pod_data_type?[((range(typ′)))](dt_non_bool_integral_enum(typ′))
{-2}  Cpp_Type?(typ′)
{-3}  non_bool_integral_enum?(typ′)
{-4}  volatile?(typ′)
{1}   pod_data_type?[((range(typ′)))](dt_volatile(dt(typ(typ′))))
```

Keeping (-3 -4) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_pod.1.2`.
`dt_pod.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  const?(typ′)
{-3}  non_bool_integral_enum?(typ(typ′))
{1}   pod_data_type?[((range(typ′)))](dt(typ′))
```

Expanding the definition of dt,
Using lemma dt_const_pod[(range(typ(typ′)))],
we get 3 subgoals:

`dt_pod.2.1:`

{-1} pod_data_type?[(range(typ(typ′)))](dt_const(dt(typ(typ′))))
{-2} Cpp_Type?(typ′)
{-3} const?(typ′)
{-4} non_bool_integral_enum?(typ(typ′))

{1} pod_data_type?[((range(typ′)))](dt_const(dt(typ(typ′))))

Expanding the definition of pod_data_type?,
Adding type constraints for dt_const(dt(typ(typ!1))),
we get 2 subgoals:
`dt_pod.2.1.1:`

{-1} interpreted_data_type?[(range(typ(typ′)))](dt_const(dt(typ(typ′))))
{-2} (∀ (*l*: list[Byte], a_1, a_2: Address):

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_pointer_TCC5.2`.
Q.E.D.

C.44.44 Cpp_Types.dt_cv_pointer_TCC6

Terse proof for `dt_cv_pointer_TCC6`.

`dt_cv_pointer_TCC6:`

{1}	∀ (typ: Cpp_Subtype(cv(pointer?)), t: Cpp_Type_): typ = const(t) ⊃ (∃ (x_1: (interpreted_data_type?[((range_pointer(cv_base(t))))])): TRUE)

Repeatedly Skolemizing and flattening,

Instantiating the top quantifier in 1 with the terms: (dt_pointer(cv_base(t!1))),

we get 3 subgoals:

`dt_cv_pointer_TCC6.1:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer?)(typ′)
{-3}	typ′ = const(t')
{1}	TRUE

which is trivially true.

This completes the proof of `dt_cv_pointer_TCC6.1`.

`dt_cv_pointer_TCC6.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer?)(typ′)
{-3}	typ′ = const(t')
{1}	pointer?(cv_base(t'))

Using lemma dt_cv_pointer_TCC5,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_pointer_TCC6.2`.

`dt_cv_pointer_TCC6.3:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer?)(typ′)
{-3}	typ′ = const(t')
{1}	Cpp_Type?(t')

Using lemma dt_cv_pointer_TCC4,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_pointer_TCC6.3`.

Q.E.D.

C.44.45 Cpp_Types.dt_cv_pointer_TCC7

Terse proof for `dt_cv_pointer_TCC7`.

dt_cv_pointer_TCC7:

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)),
          v:
            [typ1:
               {z: Cpp_Subtype(cv(pointer?)) |
                     restrict
                       [[Cpp_Type_, Cpp_Type_],
                        [Cpp_Subtype(cv(pointer?)), Cpp_Subtype(cv(pointer?))],
                        boolean]
                       (≪)(z, typ)} →
                 (interpreted_data_type?[((range_pointer(cv_base(typ1))))])],
          t: Cpp_Type_):
        typ = const(t) ⊃
         (∀ (x: lift[Pointer_Base_Type]):
            range_pointer(cv_base(t))(x) ≡ range_pointer(cv_base(typ))(x))
          ∧
          (∀ (x: lift[Pointer_Base_Type]):
             range_pointer(cv_base(t))(x) ≡ range_pointer(cv_base(typ))(x))
           ∧
           (∀ (x1: [list[Byte], Address]):

{-4}	∀ (d: ((range_pointer(cv_base(t')))), a: Address): down(from_byte(dt_const(v'(t')))(to_byte(dt_const(v'(t')))(d, a), a)) = d
{-5}	Cpp_Type?(const(t'))
{-6}	cv(pointer?)(const(t'))
{-7}	typ$'$ = const(t')
{1}	∀ (d: ((range_pointer(cv_base(typ$'$)))), a: Address): valid?(uidt(dt_const[((range_pointer(cv_base(t'))))](v'(t')))) (to_byte(dt_const[((range_pointer(cv_base(t'))))](v'(t')))(d, a), a)

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Replacing using formula -7,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `dt_cv_pointer_TCC7.2.1.1`.

`dt_cv_pointer_TCC7.2.1.2:`

```
{-1}  uninterpreted_data_type?(dt_const(v'(t'))`uidt)
{-2}  ∀ (d: ((range_pointer(cv_base(t')))), a: Address):
        valid?(uidt(dt_const(v'(t')))(to_byte(dt_const(v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_const(v'(t')))(l, a) ≡
         up?(from_byte(dt_const(v'(t')))(l, a))
{-4}  ∀ (d: ((range_pointer(cv_base(t')))), a: Address):
        down(from_byte(dt_const(v'(t')))(to_byte(dt_const(v'(t')))(d, a), a)) =
         d
{-5}  Cpp_Type?(const(t'))
{-6}  cv(pointer?)(const(t'))
{-7}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_pointer(cv_base(typ')))), a: Address):
        down(from_byte(dt_const[((range_pointer(cv_base(t'))))](v'(t')))
                    (to_byte(dt_const[((range_pointer(cv_base(t'))))](v'(t')))
                        (d, a),
                      a))
         = d
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Replacing using formula -7,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `dt_cv_pointer_TCC7.2.1.2`.

`dt_cv_pointer_TCC7.2.2:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(pointer?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∃ (x1: (interpreted_data_type?[((range_pointer(cv_base(t'))))])): TRUE
{2}   interpreted_data_type?[((range_pointer(cv_base(typ'))))]
          (dt_const[((range_pointer(cv_base(t'))))](v'(t')))
```

Using lemma dt_cv_pointer_TCC6,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_pointer_TCC7.2.2`.

`dt_cv_pointer_TCC7.2.3:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(pointer?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   pointer?(cv_base(t'))
{2}   interpreted_data_type?[((range_pointer(cv_base(typ'))))]
          (dt_const[((range_pointer(cv_base(t'))))](v'(t')))
```

Using lemma dt_cv_pointer_TCC5,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_pointer_TCC7.2.3`.

Q.E.D.

C.44.46 Cpp_Types.dt_cv_pointer_TCC8

Terse proof for `dt_cv_pointer_TCC8`.

`dt_cv_pointer_TCC8:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)), t: Cpp_Type_):
       typ = volatile(t) ⊃ Cpp_Type?(t) ∧ cv(pointer?)(t)
```

Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Applying propositional simplification,
we get 2 subgoals:

`dt_cv_pointer_TCC8.1:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(pointer?)(volatile(t'))
{-3}  typ' = volatile(t')
------------------------------
{1}   Cpp_Type?(t')
```

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_pointer_TCC8.1`.

`dt_cv_pointer_TCC8.2:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(pointer?)(volatile(t'))
{-3}  typ' = volatile(t')
------------------------------
{1}   cv(pointer?)(t')
```

Keeping (-2 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_pointer_TCC8.2`.
Q.E.D.

C.44.47 Cpp_Types.dt_cv_pointer_TCC9

Terse proof for `dt_cv_pointer_TCC9`.

`dt_cv_pointer_TCC9:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)), t: Cpp_Type_):
       typ = volatile(t) ⊃
        restrict
            [[Cpp_Type_, Cpp_Type_],
              [Cpp_Subtype(cv(pointer?)), Cpp_Subtype(cv(pointer?))], boolean]
            (≪)(t, typ)
```

Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of ■,
which is trivially true.

This completes the proof of `dt_cv_pointer_TCC9`.
Q.E.D.

C.44.48 Cpp_Types.dt_cv_pointer_TCC10

Terse proof for `dt_cv_pointer_TCC10`.
`dt_cv_pointer_TCC10:`

{1} ∀ (typ: Cpp_Subtype(cv(pointer?)), t: Cpp_Type_): typ = volatile(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_pointer_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_pointer_TCC10`.
Q.E.D.

C.44.49 Cpp_Types.dt_cv_pointer_TCC11

Terse proof for `dt_cv_pointer_TCC11`.
`dt_cv_pointer_TCC11:`

{1} ∀ (typ: Cpp_Subtype(cv(pointer?)), t: Cpp_Type_):
typ = volatile(t) ⊃ pointer?(cv_base(t))

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_pointer_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_pointer_TCC11`.
Q.E.D.

C.44.50 Cpp_Types.dt_cv_pointer_TCC12

Terse proof for `dt_cv_pointer_TCC12`.
`dt_cv_pointer_TCC12:`

{1} ∀ (typ: Cpp_Subtype(cv(pointer?)), t: Cpp_Type_):
typ = volatile(t) ⊃
(∃ (x_1: (interpreted_data_type?[((range_pointer(cv_base(t))))])): TRUE)

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (dt_pointer(cv_base(t!1))),
we get 3 subgoals:
`dt_cv_pointer_TCC12.1:`

{-1} Cpp_Type?(typ′)
{-2} cv(pointer?)(typ′)
{-3} typ′ = volatile(t')
{1} TRUE

which is trivially true.

This completes the proof of `dt_cv_pointer_TCC12.1`.

`dt_cv_pointer_TCC12.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer?)(typ′)
{-3}	typ′ = volatile(t')
{1}	pointer?(cv_base(t'))

Using lemma dt_cv_pointer_TCC11,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_pointer_TCC12.2`.

`dt_cv_pointer_TCC12.3:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer?)(typ′)
{-3}	typ′ = volatile(t')
{1}	Cpp_Type?(t')

Using lemma dt_cv_pointer_TCC8,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_pointer_TCC12.3`.

Q.E.D.

C.44.51 Cpp_Types.dt_cv_pointer_TCC13

Terse proof for `dt_cv_pointer_TCC13`.

dt_cv_pointer_TCC13:

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer?)),
          v:
            [typ1:
                {z: Cpp_Subtype(cv(pointer?)) |
                            restrict
                                 [[Cpp_Type_, Cpp_Type_],
                                   [Cpp_Subtype(cv(pointer?)), Cpp_Subtype(cv(pointer?))],
                                   boolean]
                                 (≪)(z, typ)} →
                   (interpreted_data_type?[((range_pointer(cv_base(typ1))))])],
          t: Cpp_Type_):
        typ = volatile(t) ⊃
         (∀ (x: lift[Pointer_Base_Type]):
             range_pointer(cv_base(t))(x) ≡ range_pointer(cv_base(typ))(x))
          ∧
          (∀ (x: lift[Pointer_Base_Type]):
              range_pointer(cv_base(t))(x) ≡ range_pointer(cv_base(typ))(x))
           ∧
           (∀ (x1: [list[Byte], Address]):
               every[((range_pointer(cv_base(t))))]
                    ((range_pointer(cv_base(typ))))
                    (dt_volatile[((range_pointer(cv_base(t))))](v(t))`from_byte
                          (x1)))
            ∧
            interpreted_data_type?[((range_pointer(cv_base(typ))))]
                 (dt_volatile[((range_pointer(cv_base(t))))](v(t)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of cv_base,
Replacing using formula -3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

dt_cv_pointer_TCC13.1:

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(pointer?)(volatile(t'))
{-3}  typ' = volatile(t')
-------------------------------------------------------------------
{1}   interpreted_data_type?[((range_pointer(cv_base(typ'))))]
          (dt_volatile[((range_pointer(cv_base(t'))))](v'(t')))
```

Adding type constraints for dt_volatile(v!1(t!1)),
we get 3 subgoals:

dt_cv_pointer_TCC13.1.1:

```
{-1}  interpreted_data_type?[((range_pointer(cv_base(t'))))](dt_volatile(v'(t')))
{-2}  Cpp_Type?(volatile(t'))
{-3}  cv(pointer?)(volatile(t'))
{-4}  typ' = volatile(t')
-------------------------------------------------------------------
{1}   interpreted_data_type?[((range_pointer(cv_base(typ'))))]
          (dt_volatile[((range_pointer(cv_base(t'))))](v'(t')))
```

Expanding the definition of interpreted_data_type?,
Applying propositional simplification,
we get 2 subgoals:
`dt_cv_pointer_TCC13.1.1.1:`

{-1} uninterpreted_data_type?(dt_volatile($v'(t')$)`uidt)
{-2} ∀ (d: ((range_pointer(cv_base(t')))), a: Address):
valid?(uidt(dt_volatile($v'(t')$)))(to_byte(dt_volatile($v'(t')$))(d, a), a)
{-3} ∀ (l: list[Byte], a: Address):
valid?(uidt(dt_volatile($v'(t')$)))(l, a) ≡
up?(from_byte(dt_volatile($v'(t')$))(l, a))
{-4} ∀ (d: ((range_pointer(cv_base(t')))), a: Address):
down(from_byte(dt_volatile($v'(t')$))
(to_byte(dt_volatile($v'(t')$))(d, a), a))
= d
{-5} Cpp_Type?(volatile(t'))
{-6} cv(pointer?)(volatile(t'))
{-7} typ′ = volatile(t')

{1} ∀ (d: ((range_pointer(cv_base(typ′)))), a: Address):

& \qquad ((\mathrm{range\_pointer}(\mathrm{cv\_base}(\mathrm{typ}'))))(\mathrm{dt\_pointer}(\mathrm{typ}')\text{`}\mathrm{from\_byte}(x_1))
\end{array}
$$

Expanding the definition of every,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_pointer_TCC15.2`.

dt_cv_pointer_TCC15.3:

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(typ′)
{-3}  cv(pointer?)(typ′)
-------------------------------------------------------------------------
{1}   const?(typ′)
{2}   volatile?(typ′)
{3}   ∀ (x: lift[Pointer_Base_Type]):
        range_pointer(typ′)(x) ≡ range_pointer(cv_base(typ′))(x)
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_cv_pointer_TCC15.3.
Q.E.D.

C.44.54 Cpp_Types.dt_cv_bitfield_TCC1

Terse proof for dt_cv_bitfield_TCC1.

dt_cv_bitfield_TCC1:

```
-------------------------------------------------------------------------
{1}   well_founded?(λ (x: Cpp_Subtype(cv(bitfield?)), y: Cpp_Subtype(cv(bitfield?))):
                      restrict
                        [[Cpp_Type_, Cpp_Type_],
                         [Cpp_Subtype(cv(bitfield?)), Cpp_Subtype(cv(bitfield?))], boolean]
                        (≪)(x, y))
```

Using lemma well_founded_restrict[Cpp_Type_, Cpp_Subtype(cv(bitfield?))],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of dt_cv_bitfield_TCC1.
Q.E.D.

C.44.55 Cpp_Types.dt_cv_bitfield_TCC2

Terse proof for dt_cv_bitfield_TCC2.

dt_cv_bitfield_TCC2:

```
-------------------------------------------------------------------------
{1}   ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_):
        typ = const(t) ⊃ Cpp_Type?(t) ∧ cv(bitfield?)(t)
```

Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Applying propositional simplification,
we get 2 subgoals:

dt_cv_bitfield_TCC2.1:

```
{-1}  Cpp_Type?(const(t′))
{-2}  cv(bitfield?)(const(t′))
{-3}  typ′ = const(t′)
-------------------------------------------------------------------------
{1}   Cpp_Type?(t′)
```

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),

Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC2.1`.
`dt_cv_bitfield_TCC2.2`:

{-1}	Cpp_Type?(const(t'))
{-2}	cv(bitfield?)(const(t'))
{-3}	typ$'$ = const(t')
{1}	cv(bitfield?)(t')

Keeping (-2 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC2.2`.
Q.E.D.

C.44.56 Cpp_Types.dt_cv_bitfield_TCC3

Terse proof for `dt_cv_bitfield_TCC3`.
`dt_cv_bitfield_TCC3`:

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_):
typ = const(t) ⊃
restrict
[[Cpp_Type_, Cpp_Type_],
[Cpp_Subtype(cv(bitfield?)), Cpp_Subtype(cv(bitfield?))], boolean]
(≪)(t, typ)

Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of ■,
which is trivially true.
This completes the proof of `dt_cv_bitfield_TCC3`.
Q.E.D.

C.44.57 Cpp_Types.dt_cv_bitfield_TCC4

Terse proof for `dt_cv_bitfield_TCC4`.
`dt_cv_bitfield_TCC4`:

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_): typ = const(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_bitfield_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC4`.
Q.E.D.

C.44.58 Cpp_Types.dt_cv_bitfield_TCC5

Terse proof for `dt_cv_bitfield_TCC5`.

`dt_cv_bitfield_TCC5:`

|
|---|
| {1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_): typ = const(t) ⊃ bitfield?(cv_base(t)) |

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:
`dt_cv_bitfield_TCC5.1:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(bitfield?)(typ′)
{-3}	typ′ = const(t')
{1}	cv(bitfield?)(t')
{2}	bitfield?(cv_base(t'))

Using lemma dt_cv_bitfield_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC5.1`.
`dt_cv_bitfield_TCC5.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(bitfield?)(typ′)
{-3}	typ′ = const(t')
{1}	(bitfield? ⊆ interpreted?)
{2}	bitfield?(cv_base(t'))

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC5.2`.
Q.E.D.

C.44.59 Cpp_Types.dt_cv_bitfield_TCC6

Terse proof for `dt_cv_bitfield_TCC6`.
`dt_cv_bitfield_TCC6:`

|
|---|
| {1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_): typ = const(t) ⊃ (∃ (x_1: (interpreted_data_type?[((range_bitfield(cv_base(t))))])): TRUE) |

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_bitfield_TCC2,
Using lemma dt_bitfield_exists,
we get 2 subgoals:
`dt_cv_bitfield_TCC6.1:`

{-1}	typ′ = const(t') ⊃ Cpp_Type?(t') ∧ cv(bitfield?)(t')
{-2}	Cpp_Type?(typ′)
{-3}	cv(bitfield?)(typ′)
{-4}	typ′ = const(t')
{1}	bitfield?(cv_base(t'))
{2}	∃ (x_1: (interpreted_data_type?[((range_bitfield(cv_base(t'))))])): TRUE

Using lemma dt_cv_bitfield_TCC5,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC6.1`.
`dt_cv_bitfield_TCC6.2`:

```
{-1}  typ' = const(t') ⊃ Cpp_Type?(t') ∧ cv(bitfield?)(t')
{-2}  Cpp_Type?(typ')
{-3}  cv(bitfield?)(typ')
{-4}  typ' = const(t')
------------------------------------------------------------
{1}   Cpp_Type?(t')
{2}   ∃ (x1: (interpreted_data_type?[((range_bitfield(cv_base(t'))))])): TRUE
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC6.2`.
Q.E.D.

C.44.60 Cpp_Types.dt_cv_bitfield_TCC7

Terse proof for `dt_cv_bitfield_TCC7`.
`dt_cv_bitfield_TCC7`:

```
{1}  ∀ (typ: Cpp_Subtype(cv(bitfield?)),
          v:
            [typ1:
                {z: Cpp_Subtype(cv(bitfield?)) |
                            restrict
                                [[Cpp_Type_, Cpp_Type_],
                                  [Cpp_Subtype(cv(bitfield?)), Cpp_Subtype(cv(bitfield?))],
                                  boolean]
                                (≪)(z, typ)} →
                    (interpreted_data_type?[((range_bitfield(cv_base(typ1))))])],
          t: Cpp_Type_):
       typ = const(t) ⊃
        (∀ (x: int):
             range_bitfield(cv_base(t))(x) ≡ range_bitfield(cv_base(typ))(x))
         ∧
         (∀ (x: int):
              range_bitfield(cv_base(t))(x) ≡ range_bitfield(cv_base(typ))(x))
          ∧
          (∀ (x1: [list[Byte], Address]):
               every[((range_bitfield(cv_base(t))))]
                    ((range_bitfield(cv_base(typ))))
                    (dt_const[((range_bitfield(cv_base(t))))](v(t))‘from_byte(x1)))
           ∧
           interpreted_data_type?[(range_bitfield(cv_base(typ)))]
                (dt_const[((range_bitfield(cv_base(t))))](v(t)))
```

Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of cv_base,
Applying propositional simplification,
we get 2 subgoals:

`dt_cv_bitfield_TCC7.1:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(bitfield?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∀ (x1: [list[Byte], Address]):
        every[((range_bitfield(cv_base(t'))))]
             ((range_bitfield(cv_base(const(t')))))
             (dt_const[((range_bitfield(cv_base(t'))))](v'(t'))`from_byte(x1))
```

Expanding the definition of every,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_bitfield_TCC7.1`.
`dt_cv_bitfield_TCC7.2:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(bitfield?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
          (dt_const[((range_bitfield(cv_base(t'))))](v'(t')))
```

Adding type constraints for dt_const(v!1(t!1)),
we get 3 subgoals:
`dt_cv_bitfield_TCC7.2.1:`

```
{-1}  interpreted_data_type?[((range_bitfield(cv_base(t'))))](dt_const(v'(t')))
{-2}  Cpp_Type?(const(t'))
{-3}  cv(bitfield?)(const(t'))
{-4}  typ' = const(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
          (dt_const[((range_bitfield(cv_base(t'))))](v'(t')))
```

Expanding the definition of interpreted_data_type?,
Applying propositional simplification,
we get 2 subgoals:
`dt_cv_bitfield_TCC7.2.1.1:`

```
{-1}  uninterpreted_data_type?(dt_const(v'(t'))`uidt)
{-2}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        valid?(uidt(dt_const(v'(t'))))(to_byte(dt_const(v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_const(v'(t'))))(l, a) ≡
          up?(from_byte(dt_const(v'(t')))(l, a))
{-4}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        down(from_byte(dt_const(v'(t')))(to_byte(dt_const(v'(t')))(d, a), a)) =
          d
{-5}  Cpp_Type?(const(t'))
{-6}  cv(bitfield?)(const(t'))
{-7}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_bitfield(cv_base(typ')))), a: Address):
        valid?(uidt(dt_const[((range_bitfield(cv_base(t'))))](v'(t'))))
             (to_byte(dt_const[((range_bitfield(cv_base(t'))))](v'(t')))(d, a),
               a)
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Replacing using formula -7,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_bitfield_TCC7.2.1.1`.
`dt_cv_bitfield_TCC7.2.1.2:`

```
{-1}  uninterpreted_data_type?(dt_const(v'(t'))`uidt)
{-2}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        valid?(uidt(dt_const(v'(t'))))(to_byte(dt_const(v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_const(v'(t'))))(l, a) ≡
          up?(from_byte(dt_const(v'(t')))(l, a))
{-4}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        down(from_byte(dt_const(v'(t')))(to_byte(dt_const(v'(t')))(d, a), a)) =
          d
{-5}  Cpp_Type?(const(t'))
{-6}  cv(bitfield?)(const(t'))
{-7}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_bitfield(cv_base(typ')))), a: Address):
        down(from_byte(dt_const[((range_bitfield(cv_base(t'))))](v'(t')))
                      (to_byte(dt_const[((range_bitfield(cv_base(t'))))](v'(t')))
                               (d, a),
                             a))
          = d
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Replacing using formula -7,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_bitfield_TCC7.2.1.2`.
`dt_cv_bitfield_TCC7.2.2:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(bitfield?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∃ (x1: (interpreted_data_type?[((range_bitfield(cv_base(t'))))])): TRUE
{2}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
          (dt_const[((range_bitfield(cv_base(t'))))](v'(t')))
```

Using lemma dt_cv_bitfield_TCC6,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC7.2.2`.
`dt_cv_bitfield_TCC7.2.3:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(bitfield?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   bitfield?(cv_base(t'))
{2}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
          (dt_const[((range_bitfield(cv_base(t'))))](v'(t')))
```

Using lemma dt_cv_bitfield_TCC5,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of dt_cv_bitfield_TCC7.2.3.
Q.E.D.

C.44.61 Cpp_Types.dt_cv_bitfield_TCC8

Terse proof for dt_cv_bitfield_TCC8.
dt_cv_bitfield_TCC8:

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_):
typ = volatile(t) ⊃ Cpp_Type?(t) ∧ cv(bitfield?)(t)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
dt_cv_bitfield_TCC8.1:

{-1} Cpp_Type?(typ′)
{-2} cv(bitfield?)(typ′)
{-3} typ′ = volatile(t')
{1} Cpp_Type?(t')

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Replacing using formula -4,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_cv_bitfield_TCC8.1.
dt_cv_bitfield_TCC8.2:

{-1} Cpp_Type?(typ′)
{-2} cv(bitfield?)(typ′)
{-3} typ′ = volatile(t')
{1} cv(bitfield?)(t')

Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of dt_cv_bitfield_TCC8.2.
Q.E.D.

C.44.62 Cpp_Types.dt_cv_bitfield_TCC9

Terse proof for dt_cv_bitfield_TCC9.
dt_cv_bitfield_TCC9:

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_):
typ = volatile(t) ⊃
restrict
[[Cpp_Type_, Cpp_Type_],
[Cpp_Subtype(cv(bitfield?)), Cpp_Subtype(cv(bitfield?))], boolean]
(≪)(t, typ)

Repeatedly Skolemizing and flattening,
Replacing using formula -3,

Expanding the definition of restrict,
Expanding the definition of ■,
which is trivially true.
This completes the proof of `dt_cv_bitfield_TCC9`.
Q.E.D.

C.44.63 Cpp_Types.dt_cv_bitfield_TCC10

Terse proof for `dt_cv_bitfield_TCC10`.
`dt_cv_bitfield_TCC10:`

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_): typ = volatile(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_bitfield_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC10`.
Q.E.D.

C.44.64 Cpp_Types.dt_cv_bitfield_TCC11

Terse proof for `dt_cv_bitfield_TCC11`.
`dt_cv_bitfield_TCC11:`

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_):
typ = volatile(t) ⊃ bitfield?(cv_base(t))

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_bitfield_TCC8,
Using lemma cv_base_result,
we get 2 subgoals:
`dt_cv_bitfield_TCC11.1:`

{-1} typ′ = volatile(t') ⊃ Cpp_Type?(t') ∧ cv(bitfield?)(t')
{-2} Cpp_Type?(typ′)
{-3} cv(bitfield?)(typ′)
{-4} typ′ = volatile(t')

{1} cv(bitfield?)(t')
{2} bitfield?(cv_base(t'))

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC11.1`.
`dt_cv_bitfield_TCC11.2:`

{-1} typ′ = volatile(t') ⊃ Cpp_Type?(t') ∧ cv(bitfield?)(t')
{-2} Cpp_Type?(typ′)
{-3} cv(bitfield?)(typ′)
{-4} typ′ = volatile(t')

{1} (bitfield? ⊆ interpreted?)
{2} bitfield?(cv_base(t'))

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC11.2`.

Q.E.D.

C.44.65 Cpp_Types.dt_cv_bitfield_TCC12

Terse proof for `dt_cv_bitfield_TCC12`.

`dt_cv_bitfield_TCC12:`

{1} ∀ (typ: Cpp_Subtype(cv(bitfield?)), t: Cpp_Type_):
typ = volatile(t) ⊃
($\exists$ (x_1: (interpreted_data_type?[((range_bitfield(cv_base(t))))])): TRUE)

Repeatedly Skolemizing and flattening,

Using lemma dt_bitfield_exists,

we get 2 subgoals:

`dt_cv_bitfield_TCC12.1:`

{-1} Cpp_Type?(typ′)
{-2} cv(bitfield?)(typ′)
{-3} typ′ = volatile(t')

{1} bitfield?(cv_base(t'))
{2} $\exists$ (x_1: (interpreted_data_type?[((range_bitfield(cv_base(t'))))])): TRUE

Using lemma dt_cv_bitfield_TCC11,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_bitfield_TCC12.1`.

`dt_cv_bitfield_TCC12.2:`

{-1} Cpp_Type?(typ′)
{-2} cv(bitfield?)(typ′)
{-3} typ′ = volatile(t')

{1} Cpp_Type?(t')
{2} $\exists$ (x_1: (interpreted_data_type?[((range_bitfield(cv_base(t'))))])): TRUE

Using lemma dt_cv_bitfield_TCC8,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_bitfield_TCC12.2`.

Q.E.D.

C.44.66 Cpp_Types.dt_cv_bitfield_TCC13

Terse proof for `dt_cv_bitfield_TCC13`.

`dt_cv_bitfield_TCC13:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(bitfield?)),
          v:
            [typ1:
               {z: Cpp_Subtype(cv(bitfield?)) |
                     restrict
                       [[Cpp_Type_, Cpp_Type_],
                        [Cpp_Subtype(cv(bitfield?)), Cpp_Subtype(cv(bitfield?))],
                        boolean]
                       (≪)(z, typ)} →
                 (interpreted_data_type?[((range_bitfield(cv_base(typ1))))])],
          t: Cpp_Type_):
        typ = volatile(t) ⊃
         (∀ (x: int):
            range_bitfield(cv_base(t))(x) ≡ range_bitfield(cv_base(typ))(x))
          ∧
          (∀ (x: int):
             range_bitfield(cv_base(t))(x) ≡ range_bitfield(cv_base(typ))(x))
           ∧
           (∀ (x1: [list[Byte], Address]):
              every[((range_bitfield(cv_base(t))))]
                   ((range_bitfield(cv_base(typ))))
                   (dt_volatile[((range_bitfield(cv_base(t))))](v(t))`from_byte
                         (x1)))
            ∧
            interpreted_data_type?[(range_bitfield(cv_base(typ)))]
              (dt_volatile[((range_bitfield(cv_base(t))))](v(t)))
```

Repeatedly Skolemizing and flattening,

Replacing using formula -3,

Expanding the definition of cv_base,

Applying propositional simplification,

we get 2 subgoals:

`dt_cv_bitfield_TCC13.1:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(bitfield?)(volatile(t'))
{-3}  typ' = volatile(t')
-------------------------------------------------------------------------
{1}  ∀ (x1: [list[Byte], Address]):
       every[((range_bitfield(cv_base(t'))))]
            ((range_bitfield(cv_base(volatile(t')))))
            (dt_volatile[((range_bitfield(cv_base(t'))))](v'(t'))`from_byte(x1))
```

Expanding the definition of every,

Repeatedly Skolemizing and flattening,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `dt_cv_bitfield_TCC13.1`.

`dt_cv_bitfield_TCC13.2:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(bitfield?)(volatile(t'))
{-3}  typ' = volatile(t')
------------------------------------------------------------------
{1}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
        (dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))
```

Adding type constraints for dt_volatile(v!1(t!1)),

we get 3 subgoals:

`dt_cv_bitfield_TCC13.2.1:`

```
{-1}  interpreted_data_type?[((range_bitfield(cv_base(t'))))](dt_volatile(v'(t')))
{-2}  Cpp_Type?(volatile(t'))
{-3}  cv(bitfield?)(volatile(t'))
{-4}  typ' = volatile(t')
------------------------------------------------------------------
{1}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
        (dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))
```

Expanding the definition of interpreted_data_type?,

Applying propositional simplification,

we get 2 subgoals:

`dt_cv_bitfield_TCC13.2.1.1:`

```
{-1}  uninterpreted_data_type?(dt_volatile(v'(t'))`uidt)
{-2}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        valid?(uidt(dt_volatile(v'(t'))))(to_byte(dt_volatile(v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_volatile(v'(t'))))(l, a) ≡
          up?(from_byte(dt_volatile(v'(t')))(l, a))
{-4}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        down(from_byte(dt_volatile(v'(t')))
                      (to_byte(dt_volatile(v'(t')))(d, a), a))
          = d
{-5}  Cpp_Type?(volatile(t'))
{-6}  cv(bitfield?)(volatile(t'))
{-7}  typ' = volatile(t')
------------------------------------------------------------------
{1}   ∀ (d: ((range_bitfield(cv_base(typ')))), a: Address):
        valid?(uidt(dt_volatile[((range_bitfield(cv_base(t'))))](v'(t'))))
          (to_byte(dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))(d, a),
           a)
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Replacing using formula -7,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `dt_cv_bitfield_TCC13.2.1.1`.

`dt_cv_bitfield_TCC13.2.1.2:`

```
{-1}  uninterpreted_data_type?(dt_volatile(v'(t'))`uidt)
{-2}  ∀ (d: ((range_bitfield(cv_base(t')))), a: Address):
        valid?(uidt(dt_volatile(v'(t'))))(to_byte(dt_volatile(v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_volatile(v'(t'))))(l, a) ≡

          = d
{-5}  Cpp_Type?(volatile(t'))
{-6}  cv(bitfield?)(volatile(t'))
{-7}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_bitfield(cv_base(typ')))), a: Address):
        down(from_byte(dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))
                      (to_byte(dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))
                            (d, a),
                       a))
          = d
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Replacing using formula -7,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `dt_cv_bitfield_TCC13.2.1.2`.

`dt_cv_bitfield_TCC13.2.2:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(bitfield?)(volatile(t'))
{-3}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   ∃ (x1: (interpreted_data_type?[((range_bitfield(cv_base(t'))))])): TRUE
{2}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
          (dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))
```

Using lemma dt_cv_bitfield_TCC12,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_bitfield_TCC13.2.2`.

`dt_cv_bitfield_TCC13.2.3:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(bitfield?)(volatile(t'))
{-3}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   bitfield?(cv_base(t'))
{2}   interpreted_data_type?[((range_bitfield(cv_base(typ'))))]
          (dt_volatile[((range_bitfield(cv_base(t'))))](v'(t')))
```

Using lemma dt_cv_bitfield_TCC11,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_bitfield_TCC13.2.3`.

Q.E.D.

C.44.67 Cpp_Types.dt_cv_bitfield_TCC14

Terse proof for `dt_cv_bitfield_TCC14`.

`dt_cv_bitfield_TCC14:`

$$\frac{}{\begin{array}{ll}\{1\} & \forall\ (\text{typ}\colon\ \text{Cpp\_Subtype(cv(bitfield?))})\colon \\ & \neg\ \text{volatile?(typ)} \wedge \neg\ \text{const?(typ)} \supset \text{bitfield?(typ)}\end{array}}$$

Repeatedly Skolemizing and flattening,

Hiding formulas: -1,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `dt_cv_bitfield_TCC14`.

Q.E.D.

C.44.68 Cpp_Types.dt_cv_bitfield_TCC15

Terse proof for `dt_cv_bitfield_TCC15`.

`dt_cv_bitfield_TCC15:`

$$\frac{}{\begin{array}{ll}\{1\} & \forall\ (\text{typ}\colon\ \text{Cpp\_Subtype(cv(bitfield?))})\colon \\ & \neg\ \text{volatile?(typ)} \wedge \neg\ \text{const?(typ)} \supset \\ & (\forall\ (x\colon\ \text{int})\colon\ \text{range\_bitfield(typ)}(x) \equiv \text{range\_bitfield(cv\_base(typ))}(x)) \wedge \\ & (\forall\ (x\colon\ \text{int})\colon\ \text{range\_bitfield(typ)}(x) \equiv \text{range\_bitfield(cv\_base(typ))}(x)) \wedge \\ & (\forall\ (x_1\colon\ [\text{list}[\text{Byte}],\ \text{Address}])\colon \\ & \quad \text{every}[((\text{range\_bitfield(typ)}))] \\ & \quad\quad ((\text{range\_bitfield(cv\_base(typ))}))(\text{dt\_bitfield(typ)`from\_byte}(x_1))) \\ & \wedge\ \text{interpreted\_data\_type?}[(\text{range\_bitfield(cv\_base(typ))})](\text{dt\_bitfield(typ)})\end{array}}$$

Repeatedly Skolemizing and flattening,

Using lemma cv_base_result2,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 3 subgoals:

`dt_cv_bitfield_TCC15.1:`

$$\frac{\begin{array}{ll}\{-1\} & \text{cv\_base}(\text{typ}') = \text{typ}' \\ \{-2\} & \text{Cpp\_Type?}(\text{typ}') \\ \{-3\} & \text{cv(bitfield?)}(\text{typ}')\end{array}}{\begin{array}{ll}\{1\} & \text{const?}(\text{typ}') \\ \{2\} & \text{volatile?}(\text{typ}') \\ \{3\} & \text{interpreted\_data\_type?}[((\text{range\_bitfield(cv\_base}(\text{typ}'))))](\text{dt\_bitfield}(\text{typ}'))\end{array}}$$

Replacing using formula -1,

Adding type constraints for dt_bitfield(cv_base(typ!1)),

which is trivially true.

This completes the proof of `dt_cv_bitfield_TCC15.1`.

`dt_cv_bitfield_TCC15.2`:

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(typ′)
{-3}  cv(bitfield?)(typ′)
------------------------------------------------------------------------
{1}   const?(typ′)
{2}   volatile?(typ′)
{3}   ∀ (x1: [list[Byte], Address]):
        every[((range_bitfield(typ′)))]
          ((range_bitfield(cv_base(typ′))))(dt_bitfield(typ′)‘from_byte(x1))
```

Expanding the definition of every,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC15.2`.
`dt_cv_bitfield_TCC15.3`:

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(typ′)
{-3}  cv(bitfield?)(typ′)
------------------------------------------------------------------------
{1}   const?(typ′)
{2}   volatile?(typ′)
{3}   ∀ (x: int): range_bitfield(typ′)(x) ≡ range_bitfield(cv_base(typ′))(x)
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_bitfield_TCC15.3`.
Q.E.D.

C.44.69 Cpp_Types.dt_cv_ptm_TCC1

Terse proof for `dt_cv_ptm_TCC1`.
`dt_cv_ptm_TCC1`:

```
------------------------------------------------------------------------
{1}   well_founded?(λ (x: Cpp_Subtype(cv(pointer_to_member?)),
                         y: Cpp_Subtype(cv(pointer_to_member?))):
                      restrict
                        [[Cpp_Type_, Cpp_Type_],
                          [Cpp_Subtype(cv(pointer_to_member?)),
                            Cpp_Subtype(cv(pointer_to_member?))],
                          boolean]
                        (≪)(x, y))
```

Using lemma well_founded_restrict[Cpp_Type_, Cpp_Subtype(cv(pointer_to_member?))],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of `dt_cv_ptm_TCC1`.
Q.E.D.

C.44.70 Cpp_Types.dt_cv_ptm_TCC2

Terse proof for `dt_cv_ptm_TCC2`.

dt_cv_ptm_TCC2:

{1} ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_):
typ = const(t) ⊃ Cpp_Type?(t) ∧ cv(pointer_to_member?)(t)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
dt_cv_ptm_TCC2.1:

{-1} Cpp_Type?(typ′)
{-2} cv(pointer_to_member?)(typ′)
{-3} typ′ = const(t′)
{1} Cpp_Type?(t′)

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Expanding the definition of subterm,
Replacing using formula -4,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_cv_ptm_TCC2.1.
dt_cv_ptm_TCC2.2:

{-1} Cpp_Type?(typ′)
{-2} cv(pointer_to_member?)(typ′)
{-3} typ′ = const(t′)
{1} cv(pointer_to_member?)(t′)

Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of dt_cv_ptm_TCC2.2.
Q.E.D.

C.44.71 Cpp_Types.dt_cv_ptm_TCC3

Terse proof for dt_cv_ptm_TCC3.
dt_cv_ptm_TCC3:

{1} ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_):
typ = const(t) ⊃
restrict
[[Cpp_Type_, Cpp_Type_],
[Cpp_Subtype(cv(pointer_to_member?)), Cpp_Subtype(cv(pointer_to_member?))],
boolean]
(≪)(t, typ)

Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of ■,
which is trivially true.
This completes the proof of dt_cv_ptm_TCC3.
Q.E.D.

C.44.72 Cpp_Types.dt_cv_ptm_TCC4

Terse proof for `dt_cv_ptm_TCC4`.

`dt_cv_ptm_TCC4:`

{1}	∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_): typ = const(t) ⊃ Cpp_Type?(t)

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_ptm_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC4`.
Q.E.D.

C.44.73 Cpp_Types.dt_cv_ptm_TCC5

Terse proof for `dt_cv_ptm_TCC5`.

`dt_cv_ptm_TCC5:`

{1}	∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_): typ = const(t) ⊃ pointer_to_member?(cv_base(t))

Repeatedly Skolemizing and flattening,
Using lemma cv_base_result,
we get 2 subgoals:

`dt_cv_ptm_TCC5.1:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer_to_member?)(typ′)
{-3}	typ′ = const(t')
{1}	cv(pointer_to_member?)(t')
{2}	pointer_to_member?(cv_base(t'))

Using lemma dt_cv_ptm_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC5.1`.

`dt_cv_ptm_TCC5.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(pointer_to_member?)(typ′)
{-3}	typ′ = const(t')
{1}	(pointer_to_member? ⊆ interpreted?)
{2}	pointer_to_member?(cv_base(t'))

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC5.2`.
Q.E.D.

C.44.74 Cpp_Types.dt_cv_ptm_TCC6

Terse proof for `dt_cv_ptm_TCC6`.

`dt_cv_ptm_TCC6:`

|
|---|
| {1} ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_): typ = const(t) ⊃ (∃ (x_1: (interpreted_data_type?[((range_ptm(cv_base(t))))])): TRUE) |

Repeatedly Skolemizing and flattening,

Using lemma dt_pointer_to_member_exists,

we get 3 subgoals:

`dt_cv_ptm_TCC6.1:`

{-1}	∃ (dt: (pod_data_type?[((range_ptm(cv_base(t'))))])): TRUE
{-2}	Cpp_Type?(typ$'$)

              [Cpp_Subtype(cv(pointer_to_member?)), Cpp_Subtype(cv(pointer_to_member?))],
              boolean]
            (≪)(t, typ)
```

Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of ■,

which is trivially true.
This completes the proof of `dt_cv_ptm_TCC9`.
Q.E.D.

C.44.78 Cpp_Types.dt_cv_ptm_TCC10

Terse proof for `dt_cv_ptm_TCC10`.
`dt_cv_ptm_TCC10:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_):
       typ = volatile(t) ⊃ Cpp_Type?(t)
```

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_ptm_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC10`.
Q.E.D.

C.44.79 Cpp_Types.dt_cv_ptm_TCC11

Terse proof for `dt_cv_ptm_TCC11`.
`dt_cv_ptm_TCC11:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_):
       typ = volatile(t) ⊃ pointer_to_member?(cv_base(t))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:
`dt_cv_ptm_TCC11.1:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(pointer_to_member?)(typ′)
{-3}  typ′ = volatile(t′)
-------------------------------------
{1}   cv(pointer_to_member?)(t′)
{2}   pointer_to_member?(cv_base(t′))
```

Using lemma dt_cv_ptm_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC11.1`.
`dt_cv_ptm_TCC11.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(pointer_to_member?)(typ′)
{-3}  typ′ = volatile(t′)
-------------------------------------
{1}   (pointer_to_member? ⊆ interpreted?)
{2}   pointer_to_member?(cv_base(t′))
```

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC11.2`.
Q.E.D.

C.44.80 Cpp_Types.dt_cv_ptm_TCC12

Terse proof for `dt_cv_ptm_TCC12`.

`dt_cv_ptm_TCC12:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)), t: Cpp_Type_):
       typ = volatile(t) ⊃
         (∃ (x1: (interpreted_data_type?[((range_ptm(cv_base(t))))])): TRUE)
```

Repeatedly Skolemizing and flattening,

Using lemma dt_pointer_to_member_exists,

we get 3 subgoals:

`dt_cv_ptm_TCC12.1:`

```
{-1}  ∃ (dt: (pod_data_type?[((range_ptm(cv_base(t′))))])): TRUE
{-2}  Cpp_Type?(typ′)
{-3}  cv(pointer_to_member?)(typ′)
{-4}  typ′ = volatile(t′)
------------------------------------------------------------------------
{1}   ∃ (x1: (interpreted_data_type?[((range_ptm(cv_base(t′))))])): TRUE
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

This completes the proof of `dt_cv_ptm_TCC12.1`.

`dt_cv_ptm_TCC12.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(pointer_to_member?)(typ′)
{-3}  typ′ = volatile(t′)
------------------------------------------------------------------------
{1}   pointer_to_member?(cv_base(t′))
{2}   ∃ (x1: (interpreted_data_type?[((range_ptm(cv_base(t′))))])): TRUE
```

Using lemma dt_cv_ptm_TCC11,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_ptm_TCC12.2`.

`dt_cv_ptm_TCC12.3:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(pointer_to_member?)(typ′)
{-3}  typ′ = volatile(t′)
------------------------------------------------------------------------
{1}   Cpp_Type?(t′)
{2}   ∃ (x1: (interpreted_data_type?[((range_ptm(cv_base(t′))))])): TRUE
```

Using lemma dt_cv_ptm_TCC8,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_ptm_TCC12.3`.

Q.E.D.

C.44.81 Cpp_Types.dt_cv_ptm_TCC13

Terse proof for `dt_cv_ptm_TCC13`.

`dt_cv_ptm_TCC13:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer_to_member?)),
          v:
            [typ1:
                {z: Cpp_Subtype(cv(pointer_to_member?)) |
                        restrict
                            [[Cpp_Type_, Cpp_Type_],
                              [Cpp_Subtype(cv(pointer_to_member?)),
                                Cpp_Subtype(cv(pointer_to_member?))],
                              boolean]
                            (≪)(z, typ)} →
                   (interpreted_data_type?[((range_ptm(cv_base(typ1))))])],
            t: Cpp_Type_):
       typ = volatile(t) ⊃
        (∀ (x: nat): range_ptm(cv_base(t))(x) ≡ range_ptm(cv_base(typ))(x)) ∧
         (∀ (x: nat): range_ptm(cv_base(t))(x) ≡ range_ptm(cv_base(typ))(x)) ∧
          (∀ (x1: [list[Byte], Address]):
              every[((range_ptm(cv_base(t))))]
                  ((range_ptm(cv_base(typ))))
                  (dt_volatile[((range_ptm(cv_base(t))))](v(t))`from_byte(x1)))
           ∧
           interpreted_data_type?[(range_ptm(cv_base(typ)))]
               (dt_volatile[((range_ptm(cv_base(t))))](v(t)))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of cv_base,
Replacing using formula -3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`dt_cv_ptm_TCC13.1:`

```
{-1}  Cpp_Type?(volatile(t'))
{-2}  cv(pointer_to_member?)(volatile(t'))
{-3}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range_ptm(cv_base(typ'))))]
          (dt_volatile[((range_ptm(cv_base(t'))))](v'(t')))
```

Adding type constraints for dt_volatile[((range_ptm(cv_base(t!1))))](v!1(t!1)),
we get 3 subgoals:
`dt_cv_ptm_TCC13.1.1:`

```
{-1}  interpreted_data_type?[((range_ptm(cv_base(t'))))]
          (dt_volatile[((range_ptm(cv_base(t'))))](v'(t')))
{-2}  Cpp_Type?(volatile(t'))
{-3}  cv(pointer_to_member?)(volatile(t'))
{-4}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range_ptm(cv_base(typ'))))]
          (dt_volatile[((range_ptm(cv_base(t'))))](v'(t')))
```

Expanding the definition of interpreted_data_type?,
Applying propositional simplification,
we get 2 subgoals:

`dt_cv_ptm_TCC13.1.1.1:`

```
{-1}  uninterpreted_data_type?(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))`uidt)
{-2}  ∀ (d: (((range_ptm(cv_base(t')))))), a: Address):
        valid?(uidt(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))))
            (to_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))))(l, a) ≡
          up?(from_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))(l, a))
{-4}  ∀ (d: (((range_ptm(cv_base(t')))))), a: Address):
        down(from_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))
                    (to_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))
                        (d, a),
                      a))
          = d
{-5}  Cpp_Type?(volatile(t'))
{-6}  cv(pointer_to_member?)(volatile(t'))
{-7}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_ptm(cv_base(typ')))), a: Address):
        valid?(uidt(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))))
            (to_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))(d, a), a)
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Replacing using formula -7,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_ptm_TCC13.1.1.1`.
`dt_cv_ptm_TCC13.1.1.2:`

```
{-1}  uninterpreted_data_type?(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))`uidt)

        valid?(uidt(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))))
            (to_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))(d, a), a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_volatile[((range_ptm(cv_base(t')))))](v'(t'))))(l, a) ≡
          up?(from_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))(l, a))
{-4}  ∀ (d: (((range_ptm(cv_base(t')))))), a: Address):
        down(from_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))
                    (to_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))
                        (d, a),
                      a))
          = d
{-5}  Cpp_Type?(volatile(t'))
{-6}  cv(pointer_to_member?)(volatile(t'))
{-7}  typ' = volatile(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_ptm(cv_base(typ')))), a: Address):
        down(from_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))
                    (to_byte(dt_volatile[((range_ptm(cv_base(t')))))](v'(t')))
                        (d, a),
                      a))
          = d
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,
Replacing using formula -7,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_ptm_TCC13.1.1.2`.
`dt_cv_ptm_TCC13.1.2`:

{-1}	Cpp_Type?(volatile(t'))
{-2}	cv(pointer_to_member?)(volatile(t'))
{-3}	typ$'$ = volatile(t')
{1}	$\exists$ (x_1: (interpreted_data_type?[((range_ptm(cv_base(t'))))])): TRUE
{2}	interpreted_data_type?[((range_ptm(cv_base(typ$'$))))] (dt_volatile[((range_ptm(cv_base(t'))))](v'(t')))

Using lemma dt_cv_ptm_TCC12,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC13.1.2`.
`dt_cv_ptm_TCC13.1.3`:

{-1}	Cpp_Type?(volatile(t'))
{-2}	cv(pointer_to_member?)(volatile(t'))
{-3}	typ$'$ = volatile(t')
{1}	pointer_to_member?(cv_base(t'))
{2}	interpreted_data_type?[((range_ptm(cv_base(typ$'$))))] (dt_volatile[((range_ptm(cv_base(t'))))](v'(t')))

Using lemma dt_cv_ptm_TCC11,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC13.1.3`.
`dt_cv_ptm_TCC13.2`:

{-1}	Cpp_Type?(volatile(t'))
{-2}	cv(pointer_to_member?)(volatile(t'))
{-3}	typ$'$ = volatile(t')
{1}	$\forall$ (x_1: [list[Byte], Address]): every[((range_ptm(cv_base(t'))))] ((range_ptm(cv_base(volatile(t'))))) (dt_volatile[((range_ptm(cv_base(t'))))](v'(t'))`from_byte(x_1))

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_ptm_TCC13.2`.
Q.E.D.

C.44.82 Cpp_Types.dt_cv_ptm_TCC14

Terse proof for `dt_cv_ptm_TCC14`.
`dt_cv_ptm_TCC14`:

{1}	$\forall$ (typ: Cpp_Subtype(cv(pointer_to_member?))): $\neg$ volatile?(typ) $\wedge$ $\neg$ const?(typ) $\supset$ pointer_to_member?(typ)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC14`.
Q.E.D.

C.44.83 Cpp_Types.dt_cv_ptm_TCC15

Terse proof for `dt_cv_ptm_TCC15`.
`dt_cv_ptm_TCC15:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(pointer_to_member?))):
       ¬ volatile?(typ) ∧ ¬ const?(typ) ⊃
        (∀ (x: nat): range_ptm(typ)(x) ≡ range_ptm(cv_base(typ))(x)) ∧
         (∀ (x: nat): range_ptm(typ)(x) ≡ range_ptm(cv_base(typ))(x)) ∧
          (∀ (x1: [list[Byte], Address]):
               every[((range_ptm(typ)))]
                    ((range_ptm(cv_base(typ))))(dt_ptm(typ)‘from_byte(x1)))
            ∧ interpreted_data_type?[(range_ptm(cv_base(typ)))](dt_ptm(typ))
```

Repeatedly Skolemizing and flattening,
Using lemma cv_base_result2,
Simplifying, rewriting, and recording with decision procedures,
Replacing using formula -1,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 3 subgoals:
`dt_cv_ptm_TCC15.1:`

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(cv_base(typ′))
{-3}  cv(pointer_to_member?)(cv_base(typ′))
-------------------------------------------
{1}   volatile?(cv_base(typ′))
{2}   const?(cv_base(typ′))
{3}   interpreted_data_type?[((range_ptm(cv_base(typ′))))](dt_ptm(cv_base(typ′)))
```

Adding type constraints for dt_ptm(cv_base(typ!1)),
Rewriting using pod_is_interpreted_data, matching in *,
This completes the proof of `dt_cv_ptm_TCC15.1`.
`dt_cv_ptm_TCC15.2:`

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(cv_base(typ′))
{-3}  cv(pointer_to_member?)(cv_base(typ′))
-------------------------------------------
{1}   volatile?(cv_base(typ′))
{2}   const?(cv_base(typ′))
{3}   ∀ (x1: [list[Byte], Address]):
        every[((range_ptm(typ′)))]
             ((range_ptm(cv_base(cv_base(typ′)))))(dt_ptm(cv_base(typ′))‘from_byte(x1))
```

Expanding the definition of every,
Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_ptm_TCC15.2`.

dt_cv_ptm_TCC15.3:

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(cv_base(typ′))
{-3}  cv(pointer_to_member?)(cv_base(typ′))
------------------------------------------------------------
{1}   volatile?(cv_base(typ′))
{2}   const?(cv_base(typ′))
{3}   ∀ (x: nat):
        range_ptm(cv_base(typ′))(x) ≡ range_ptm(cv_base(cv_base(typ′)))(x)
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_cv_ptm_TCC15.3.
Q.E.D.

C.44.84 Cpp_Types.dt_cv_float_TCC1

Terse proof for dt_cv_float_TCC1.
dt_cv_float_TCC1:

```
------------------------------------------------------------
{1}   well_founded?(λ (x: Cpp_Subtype(cv(floating_point?)),
                       y: Cpp_Subtype(cv(floating_point?))):
                      restrict
                        [[Cpp_Type_, Cpp_Type_],
                         [Cpp_Subtype(cv(floating_point?)),
                          Cpp_Subtype(cv(floating_point?))],
                         boolean]
                        (≪)(x, y))
```

Using lemma well_founded_restrict[Cpp_Type_, Cpp_Subtype(cv(floating_point?))],
Expanding the definition of restrict,
which is trivially true.
This completes the proof of dt_cv_float_TCC1.
Q.E.D.

C.44.85 Cpp_Types.dt_cv_float_TCC2

Terse proof for dt_cv_float_TCC2.
dt_cv_float_TCC2:

```
------------------------------------------------------------
{1}   ∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_):
        typ = const(t) ⊃ Cpp_Type?(t) ∧ cv(floating_point?)(t)
```

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
dt_cv_float_TCC2.1:

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(floating_point?)(typ′)
{-3}  typ′ = const(t′)
------------------------------------------------------------
{1}   Cpp_Type?(t′)
```

Expanding the definition of Cpp_Type?,

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Expanding the definition of subterm,
Replacing using formula -4,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC2.1`.
`dt_cv_float_TCC2.2`:

```
{-1}  Cpp_Type?(typ')
{-2}  cv(floating_point?)(typ')
{-3}  typ' = const(t')
-------------------------------
{1}   cv(floating_point?)(t')
```

Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_float_TCC2.2`.
Q.E.D.

C.44.86 Cpp_Types.dt_cv_float_TCC3

Terse proof for `dt_cv_float_TCC3`.
`dt_cv_float_TCC3`:

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_):
       typ = const(t) ⊃
        restrict
            [[Cpp_Type_, Cpp_Type_],
              [Cpp_Subtype(cv(floating_point?)), Cpp_Subtype(cv(floating_point?))], boolean]
            (≪)(t, typ)
```

Expanding the definition of ≪,
Expanding the definition of restrict,
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC3`.
Q.E.D.

C.44.87 Cpp_Types.dt_cv_float_TCC4

Terse proof for `dt_cv_float_TCC4`.
`dt_cv_float_TCC4`:

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_):
       typ = const(t) ⊃ Cpp_Type?(t)
```

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_float_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC4`.
Q.E.D.

C.44.88 Cpp_Types.dt_cv_float_TCC5

Terse proof for `dt_cv_float_TCC5`.

`dt_cv_float_TCC5:`

{1}	∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_): typ = const(t) ⊃ floating_point?(cv_base(t))

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:

`dt_cv_float_TCC5.1:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = const(t')
{1}	cv(floating_point?)(t')
{2}	floating_point?(cv_base(t'))

Using lemma dt_cv_float_TCC2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC5.1`.

`dt_cv_float_TCC5.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = const(t')
{1}	(floating_point? ⊆ interpreted?)
{2}	floating_point?(cv_base(t'))

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_float_TCC5.2`.
Q.E.D.

C.44.89 Cpp_Types.dt_cv_float_TCC6

Terse proof for `dt_cv_float_TCC6`.

`dt_cv_float_TCC6:`

{1}	∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_): typ = const(t) ⊃ (∃ (x_1: (interpreted_data_type?[((range_floating_point(cv_base(t))))])): TRUE)

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (dt_floating_point(cv_base(t!1))),
we get 3 subgoals:

`dt_cv_float_TCC6.1:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = const(t')
{1}	TRUE

which is trivially true.

This completes the proof of `dt_cv_float_TCC6.1`.

`dt_cv_float_TCC6.2`:

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = const(t')
{1}	floating_point?(cv_base(t'))

Using lemma dt_cv_float_TCC5,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_float_TCC6.2`.

`dt_cv_float_TCC6.3`:

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = const(t')
{1}	Cpp_Type?(t')

Using lemma dt_cv_float_TCC2,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_float_TCC6.3`.

Q.E.D.

C.44.90 Cpp_Types.dt_cv_float_TCC7

Terse proof for `dt_cv_float_TCC7`.

`dt_cv_float_TCC7:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)),
          v:
            [typ1:
                {z: Cpp_Subtype(cv(floating_point?)) |
                            restrict
                                [[Cpp_Type_, Cpp_Type_],
                                  [Cpp_Subtype(cv(floating_point?)),
                                    Cpp_Subtype(cv(floating_point?))],
                                  boolean]
                                (≪)(z, typ)} →
                   (interpreted_data_type?[((range_floating_point(cv_base(typ1))))])],
          t: Cpp_Type_):
        typ = const(t) ⊃
         (∀ (x: extended_real):
             range_floating_point(cv_base(t))(x) ≡
              range_floating_point(cv_base(typ))(x))
          ∧
          (∀ (x: extended_real):
             range_floating_point(cv_base(t))(x) ≡
              range_floating_point(cv_base(typ))(x))
          ∧
          (∀ (x₁: [list[Byte], Address]):
             every[((range_floating_point(cv_base(t))))]
                  ((range_floating_point(cv_base(typ))))
                  (dt_const[((range_floating_point(cv_base(t))))](v(t))`from_byte
                        (x₁)))
           ∧
           interpreted_data_type?[(range_floating_point(cv_base(typ)))]
              (dt_const[((range_floating_point(cv_base(t))))](v(t)))
```

Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Expanding the definition of cv_base,
Applying propositional simplification,
we get 2 subgoals:

`dt_cv_float_TCC7.1:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(floating_point?)(const(t'))
{-3}  typ' = const(t')
-------------------------------------------------------------------------
{1}  ∀ (x₁: [list[Byte], Address]):
       every[((range_floating_point(cv_base(t'))))]
            ((range_floating_point(cv_base(const(t')))))
            (dt_const[((range_floating_point(cv_base(t'))))](v'(t'))`from_byte(x₁))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_float_TCC7.1`.

`dt_cv_float_TCC7.2:`

```
{-1}  Cpp_Type?(const(t'))
{-2}  cv(floating_point?)(const(t'))
{-3}  typ' = const(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range_floating_point(cv_base(typ'))))]
        (dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
```

Adding type constraints for dt_const[((range_floating_point(cv_base(t!1))))](v!1(t!1)),
we get 3 subgoals:

`dt_cv_float_TCC7.2.1:`

```
{-1}  interpreted_data_type?[((range_floating_point(cv_base(t'))))]
        (dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
{-2}  Cpp_Type?(const(t'))
{-3}  cv(floating_point?)(const(t'))
{-4}  typ' = const(t')
------------------------------------------------------------------------
{1}   interpreted_data_type?[((range_floating_point(cv_base(typ'))))]
        (dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
```

Expanding the definition of interpreted_data_type?,
Applying propositional simplification,
we get 2 subgoals:

`dt_cv_float_TCC7.2.1.1:`

```
{-1}  uninterpreted_data_type?(dt_const[((range_floating_point(cv_base(t'))))]
                                 (v'(t'))`uidt)
{-2}  ∀ (d: (((range_floating_point(cv_base(t'))))), a: Address):
        valid?(uidt(dt_const[((range_floating_point(cv_base(t'))))](v'(t'))))
          (to_byte(dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
             (d, a),
           a)
{-3}  ∀ (l: list[Byte], a: Address):
        valid?(uidt(dt_const[((range_floating_point(cv_base(t'))))](v'(t'))))
          (l, a)
        ≡
        up?(from_byte(dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
             (l, a))
{-4}  ∀ (d: (((range_floating_point(cv_base(t'))))), a: Address):
        down(from_byte(dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
               (to_byte(dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
                  (d, a),
                a))
        = d
{-5}  Cpp_Type?(const(t'))
{-6}  cv(floating_point?)(const(t'))
{-7}  typ' = const(t')
------------------------------------------------------------------------
{1}   ∀ (d: ((range_floating_point(cv_base(typ'))))), a: Address):
        valid?(uidt(dt_const[((range_floating_point(cv_base(t'))))](v'(t'))))
          (to_byte(dt_const[((range_floating_point(cv_base(t'))))](v'(t')))
             (d, a),
           a)
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,

Replacing using formula -8,
Expanding the definition of cv_base,
which is trivially true.
This completes the proof of `dt_cv_float_TCC7.2.1.1`.
`dt_cv_float_TCC7.2.1.2`:

{-1} uninterpreted_data_type?(dt_const[((range_floating_point(cv_base(t'))))] ($v'(t')$)`uidt)
{-2} ∀ (d: (((range_floating_point(cv_base(t'))))), a: Address):
valid?(uidt(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(to_byte(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(d, a),
a)
{-3} ∀ (l: list[Byte], a: Address):
valid?(uidt(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(l, a)
≡
up?(from_byte(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(l, a))
{-4} ∀ (d: (((range_floating_point(cv_base(t'))))), a: Address):
down(from_byte(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(to_byte(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(d, a),
a))
= d
{-5} Cpp_Type?(const(t'))
{-6} cv(floating_point?)(const(t'))
{-7} typ′ = const(t')

{1} ∀ (d: ((range_floating_point(cv_base(typ′)))), a: Address):
down(from_byte(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(to_byte(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))
(d, a),
a))
= d

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of cv_base,
Replacing using formula -8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC7.2.1.2`.
`dt_cv_float_TCC7.2.2`:

{-1} Cpp_Type?(const(t'))
{-2} cv(floating_point?)(const(t'))
{-3} typ′ = const(t')

{1} ∃ (x_1: (interpreted_data_type?[((range_floating_point(cv_base(t'))))])): TRUE
{2} interpreted_data_type?[((range_floating_point(cv_base(typ′))))]
(dt_const[((range_floating_point(cv_base(t'))))]($v'(t')$))

Using lemma dt_cv_float_TCC6,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC7.2.2`.

dt_cv_float_TCC7.2.3:

{-1}	Cpp_Type?(const(t'))
{-2}	cv(floating_point?)(const(t'))
{-3}	typ$'$ = const(t')
{1}	floating_point?(cv_base(t'))
{2}	interpreted_data_type?[((range_floating_point(cv_base(typ$'$))))] (dt_const[((range_floating_point(cv_base(t'))))](v'(t')))

Using lemma dt_cv_float_TCC5,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_cv_float_TCC7.2.3.
Q.E.D.

C.44.91 Cpp_Types.dt_cv_float_TCC8

Terse proof for dt_cv_float_TCC8.
dt_cv_float_TCC8:

{1}	$\forall$ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_): typ = volatile(t) $\supset$ Cpp_Type?(t) $\wedge$ cv(floating_point?)(t)

Repeatedly Skolemizing and flattening,
Applying propositional simplification,
we get 2 subgoals:
dt_cv_float_TCC8.1:

{-1}	Cpp_Type?(typ$'$)
{-2}	cv(floating_point?)(typ$'$)
{-3}	typ$'$ = volatile(t')
{1}	Cpp_Type?(t')

Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: (t!2),
Expanding the definition of subterm,
Replacing using formula -4,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of dt_cv_float_TCC8.1.
dt_cv_float_TCC8.2:

{-1}	Cpp_Type?(typ$'$)
{-2}	cv(floating_point?)(typ$'$)
{-3}	typ$'$ = volatile(t')
{1}	cv(floating_point?)(t')

Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of dt_cv_float_TCC8.2.
Q.E.D.

C.44.92 Cpp_Types.dt_cv_float_TCC9

Terse proof for dt_cv_float_TCC9.

`dt_cv_float_TCC9:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_):
       typ = volatile(t) ⊃
        restrict
             [[Cpp_Type_, Cpp_Type_],
                [Cpp_Subtype(cv(floating_point?)), Cpp_Subtype(cv(floating_point?))], boolean]
             (≪)(t, typ)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of restrict,
Expanding the definition of ■,
Replacing using formula -3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC9`.
Q.E.D.

C.44.93 Cpp_Types.dt_cv_float_TCC10

Terse proof for `dt_cv_float_TCC10`.

`dt_cv_float_TCC10:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_):
       typ = volatile(t) ⊃ Cpp_Type?(t)
```

Repeatedly Skolemizing and flattening,
Using lemma dt_cv_float_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC10`.
Q.E.D.

C.44.94 Cpp_Types.dt_cv_float_TCC11

Terse proof for `dt_cv_float_TCC11`.

`dt_cv_float_TCC11:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_):
       typ = volatile(t) ⊃ floating_point?(cv_base(t))
```

Repeatedly Skolemizing and flattening,
Rewriting using cv_base_result, matching in *,
we get 2 subgoals:

`dt_cv_float_TCC11.1:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(floating_point?)(typ′)
{-3}  typ′ = volatile(t′)
-------------------------------
{1}   cv(floating_point?)(t′)
{2}   floating_point?(cv_base(t′))
```

Using lemma dt_cv_float_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC11.1`.

`dt_cv_float_TCC11.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = volatile(t')
{1}	(floating_point? ⊆ interpreted?)
{2}	floating_point?(cv_base(t'))

Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_float_TCC11.2`.
Q.E.D.

C.44.95 Cpp_Types.dt_cv_float_TCC12

Terse proof for `dt_cv_float_TCC12`.

`dt_cv_float_TCC12:`

{1}	∀ (typ: Cpp_Subtype(cv(floating_point?)), t: Cpp_Type_): typ = volatile(t) ⊃ (∃ (x_1: (interpreted_data_type?[((range_floating_point(cv_base(t))))])): TRUE)

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (dt_floating_point(cv_base(t!1))),
we get 3 subgoals:

`dt_cv_float_TCC12.1:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = volatile(t')
{1}	TRUE

which is trivially true.
This completes the proof of `dt_cv_float_TCC12.1`.

`dt_cv_float_TCC12.2:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = volatile(t')
{1}	floating_point?(cv_base(t'))

Using lemma dt_cv_float_TCC11,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC12.2`.

`dt_cv_float_TCC12.3:`

{-1}	Cpp_Type?(typ′)
{-2}	cv(floating_point?)(typ′)
{-3}	typ′ = volatile(t')
{1}	Cpp_Type?(t')

Using lemma dt_cv_float_TCC8,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC12.3`.
Q.E.D.

C.44.96 Cpp_Types.dt_cv_float_TCC13

Terse proof for `dt_cv_float_TCC13`.

`dt_cv_float_TCC13:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?)),
          v:
            [typ1:
               {z: Cpp_Subtype(cv(floating_point?)) |
                     restrict
                       [[Cpp_Type_, Cpp_Type_],
                         [Cpp_Subtype(cv(floating_point?)),
                           Cpp_Subtype(cv(floating_point?))],
                         boolean]
                       (≪)(z, typ)} →
                 (interpreted_data_type?[((range_floating_point(cv_base(typ1))))])],
          t: Cpp_Type_):
       typ = volatile(t) ⊃
        (∀ (x: extended_real):

-------------------------------------------------------------------------
{1}   ∀ (d: ((range_floating_point(cv_base(typ′)))), a: Address):
        down(from_byte(dt_volatile[((range_floating_point(cv_base(t′))))](v′(t′)))
                (to_byte(dt_volatile[((range_floating_point(cv_base(t′))))](v′(t′)))
                    (d, a),
                  a))
          = d
```

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Replacing using formula -8,

Expanding the definition of cv_base,

which is trivially true.

This completes the proof of `dt_cv_float_TCC13.1.1.2`.

`dt_cv_float_TCC13.1.2:`

```
{-1}  Cpp_Type?(typ′)
{-2}  cv(floating_point?)(typ′)
{-3}  typ′ = volatile(t′)
-------------------------------------------------------------------------
{1}   ∃ (x1: (interpreted_data_type?[((range_floating_point(cv_base(t′))))])): TRUE
{2}   interpreted_data_type?[((range_floating_point(cv_base(typ′))))]
          (dt_volatile[((range_floating_point(cv_base(t′))))](v′(t′)))
```

Using lemma dt_cv_float_TCC12,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `dt_cv_float_TCC13.1.2`.

`dt_cv_float_TCC13.1.3:`

{-1} Cpp_Type?(typ′)
{-2} cv(floating_point?)(typ′)
{-3} typ′ = volatile(t′)

{1} floating_point?(cv_base(t′))
{2} interpreted_data_type?[((range_floating_point(cv_base(typ′))))]
(dt_volatile[((range_floating_point(cv_base(t′))))](v′(t′)))

Using lemma dt_cv_float_TCC11,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC13.1.3`.
`dt_cv_float_TCC13.2:`

{-1} Cpp_Type?(typ′)
{-2} cv(floating_point?)(typ′)
{-3} typ′ = volatile(t′)

{1} ∀ (x1: [list[Byte], Address]):
every[((range_floating_point(cv_base(t′))))]
((range_floating_point(cv_base(typ′))))
(dt_volatile[((range_floating_point(cv_base(t′))))](v′(t′))‘from_byte
(x1))

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of cv_base,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Replacing using formula -3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC13.2`.
`dt_cv_float_TCC13.3:`

{-1} Cpp_Type?(typ′)
{-2} cv(floating_point?)(typ′)
{-3} typ′ = volatile(t′)

{1} ∀ (x: extended_real):
range_floating_point(cv_base(t′))(x) ≡
range_floating_point(cv_base(typ(typ′)))(x)

Replacing using formula -3,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC13.3`.
Q.E.D.

C.44.97 Cpp_Types.dt_cv_float_TCC14

Terse proof for `dt_cv_float_TCC14`.
`dt_cv_float_TCC14:`

{1} ∀ (typ: Cpp_Subtype(cv(floating_point?))):
¬ volatile?(typ) ∧ ¬ const?(typ) ⊃ floating_point?(typ)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `dt_cv_float_TCC14`.
Q.E.D.

C.44.98 Cpp_Types.dt_cv_float_TCC15

Terse proof for `dt_cv_float_TCC15`.
`dt_cv_float_TCC15:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(floating_point?))):
       ¬ volatile?(typ) ∧ ¬ const?(typ) ⊃
        (∀ (x: extended_real):
             range_floating_point(typ)(x) ≡ range_floating_point(cv_base(typ))(x))
         ∧
         (∀ (x: extended_real):
              range_floating_point(typ)(x) ≡ range_floating_point(cv_base(typ))(x))
          ∧
          (∀ (x1: [list[Byte], Address]):
               every[((range_floating_point(typ)))]
                    ((range_floating_point(cv_base(typ))))
                    (dt_floating_point(typ)`from_byte(x1)))
           ∧
           interpreted_data_type?[(range_floating_point(cv_base(typ)))]
                (dt_floating_point(typ))
```

Repeatedly Skolemizing and flattening,
Using lemma cv_base_result2,
Simplifying, rewriting, and recording with decision procedures,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 3 subgoals:
`dt_cv_float_TCC15.1:`

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(typ′)
{-3}  cv(floating_point?)(typ′)
-------------------------------
{1}   volatile?(typ′)
{2}   const?(typ′)
{3}   interpreted_data_type?[((range_floating_point(cv_base(typ′))))]
          (dt_floating_point(typ′))
```

Replacing using formula -1,
Adding type constraints for dt_floating_point(cv_base(typ!1)),
Rewriting using pod_is_interpreted_data, matching in *,
This completes the proof of `dt_cv_float_TCC15.1`.
`dt_cv_float_TCC15.2:`

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(typ′)
{-3}  cv(floating_point?)(typ′)
-------------------------------
{1}   volatile?(typ′)
{2}   const?(typ′)
{3}   ∀ (x1: [list[Byte], Address]):
        every[((range_floating_point(typ′)))]
             ((range_floating_point(cv_base(typ′))))(dt_floating_point(typ′)`from_byte(x1))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC15.2`.
`dt_cv_float_TCC15.3`:

```
{-1}  cv_base(typ′) = typ′
{-2}  Cpp_Type?(typ′)
{-3}  cv(floating_point?)(typ′)
------------------------------------------------------------------------
{1}   volatile?(typ′)
{2}   const?(typ′)
{3}   ∀ (x: extended_real):
        range_floating_point(typ′)(x) ≡ range_floating_point(cv_base(typ′))(x)
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `dt_cv_float_TCC15.3`.
Q.E.D.

C.44.99 Cpp_Types.uidt_TCC1

Terse proof for `uidt_TCC1`.
`uidt_TCC1`:

```
------------------------------------------------------------------------
{1}   ∀ (typ: Cpp_Type, r: Cpp_Type_, a: list[Cpp_Type_], v: bool):
        typ = function_type(r, a, v) ⊃ function?(typ)
```

Repeatedly Skolemizing and flattening,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC1`.
Q.E.D.

C.44.100 Cpp_Types.uidt_TCC2

Terse proof for `uidt_TCC2`.
`uidt_TCC2`:

```
------------------------------------------------------------------------
{1}   ∀ (typ: Cpp_Type, t: Cpp_Type_): typ = pointer(t) ⊃ cv(pointer?)(typ)
```

Repeatedly Skolemizing and flattening,
Replacing using formula -2,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC2`.
Q.E.D.

C.44.101 Cpp_Types.uidt_TCC3

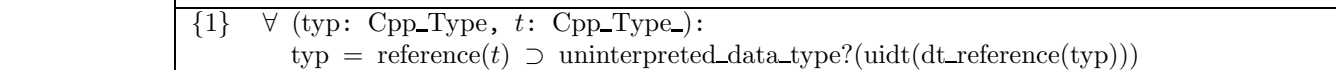
Terse proof for `uidt_TCC3`.
`uidt_TCC3`:

```
------------------------------------------------------------------------
{1}   ∀ (typ: Cpp_Type, t: Cpp_Type_):
        typ = pointer(t) ⊃ uninterpreted_data_type?(uidt(dt_cv_pointer(typ)))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_pointer(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC3`.
Q.E.D.

C.44.102 Cpp_Types.uidt_TCC4

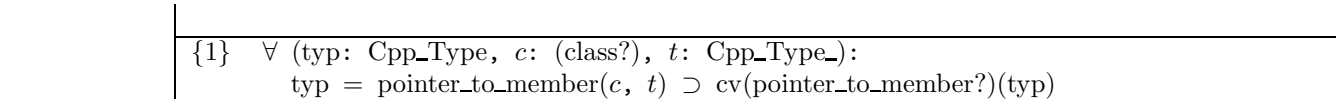
Terse proof for `uidt_TCC4`.
`uidt_TCC4:`



Repeatedly Skolemizing and flattening,
Adding type constraints for dt_reference(typ!1),
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC4`.
Q.E.D.

C.44.103 Cpp_Types.uidt_TCC5

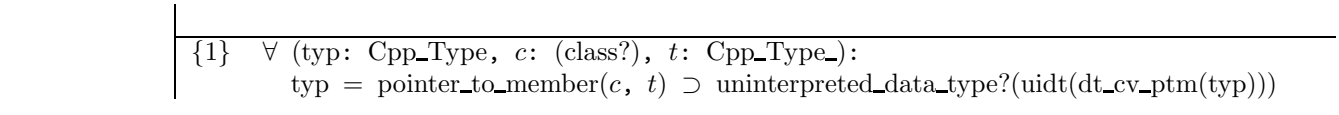
Terse proof for `uidt_TCC5`.
`uidt_TCC5:`



Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC5`.
Q.E.D.

C.44.104 Cpp_Types.uidt_TCC6

Terse proof for `uidt_TCC6`.
`uidt_TCC6:`



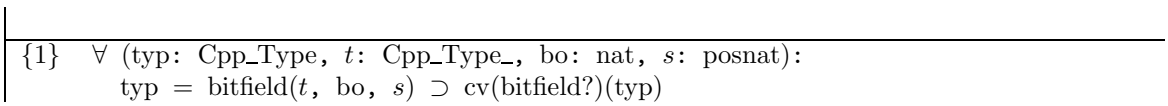
Repeatedly Skolemizing and flattening,
Replacing using formula -3,
Adding type constraints for dt_cv_ptm(pointer_to_member(c!1, t!1)),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC6`.

Q.E.D.

C.44.105 Cpp_Types.uidt_TCC7

Terse proof for `uidt_TCC7`.

`uidt_TCC7`:

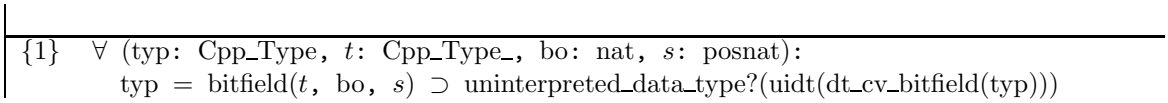


Repeatedly Skolemizing and flattening,
Replacing using formula -4,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC7`.
Q.E.D.

C.44.106 Cpp_Types.uidt_TCC8

Terse proof for `uidt_TCC8`.

`uidt_TCC8`:

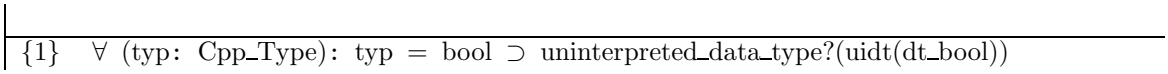


Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_bitfield(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC8`.
Q.E.D.

C.44.107 Cpp_Types.uidt_TCC9

Terse proof for `uidt_TCC9`.

`uidt_TCC9`:



Repeatedly Skolemizing and flattening,
Adding type constraints for dt_bool,
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC9`.
Q.E.D.

C.44.108 Cpp_Types.uidt_TCC10

Terse proof for `uidt_TCC10`.

uidt_TCC10:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
t = bool ∧ typ = const(t) ⊃ uninterpreted_data_type?(uidt(dt_bool))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_bool,
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC10.
Q.E.D.

C.44.109 Cpp_Types.uidt_TCC11

Terse proof for uidt_TCC11.

uidt_TCC11:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃ (∀ (t_1: Cpp_Type_): t = pointer(t_1) ⊃ cv(pointer?)(typ))

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of uidt_TCC11.
Q.E.D.

C.44.110 Cpp_Types.uidt_TCC12

Terse proof for uidt_TCC12.

uidt_TCC12:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃
(∀ (t_1: Cpp_Type_):
t = pointer(t_1) ⊃ uninterpreted_data_type?(uidt(dt_cv_pointer(typ))))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_pointer(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC12.
Q.E.D.

C.44.111 Cpp_Types.uidt_TCC13

Terse proof for uidt_TCC13.

uidt_TCC13:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃
(∀ (c: (class?), t_1: Cpp_Type_):
t = pointer_to_member(c, t_1) ⊃ cv(pointer_to_member?)(typ))

Repeatedly Skolemizing and flattening,
Hiding formulas: -2,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of uidt_TCC13.
Q.E.D.

C.44.112 Cpp_Types.uidt_TCC14

Terse proof for uidt_TCC14.

uidt_TCC14:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃
(∀ (c: (class?), t_1: Cpp_Type_):
t = pointer_to_member(c, t_1) ⊃ uninterpreted_data_type?(uidt(dt_cv_ptm(typ))))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_ptm(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC14.
Q.E.D.

C.44.113 Cpp_Types.uidt_TCC15

Terse proof for uidt_TCC15.

uidt_TCC15:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃
(∀ (t_1: Cpp_Type_, bo: nat, s: posnat):
t = bitfield(t_1, bo, s) ⊃ cv(bitfield?)(typ))

Repeatedly Skolemizing and flattening,
Hiding formulas: -3,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of uidt_TCC15.
Q.E.D.

C.44.114 Cpp_Types.uidt_TCC16

Terse proof for uidt_TCC16.

uidt_TCC16:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = const(t) ⊃
(∀ (t_1: Cpp_Type_, bo: nat, s: posnat):
t = bitfield(t_1, bo, s) ⊃ uninterpreted_data_type?(uidt(dt_cv_bitfield(typ))))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_bitfield(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC16.
Q.E.D.

C.44.115 Cpp_Types.uidt_TCC17

Terse proof for uidt_TCC17.

uidt_TCC17:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
floating_point?(t) ∧
¬ volatile?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = const(t)
⊃ cv(floating_point?)(typ)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of uidt_TCC17.
Q.E.D.

C.44.116 Cpp_Types.uidt_TCC18

Terse proof for uidt_TCC18.

uidt_TCC18:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
floating_point?(t) ∧
¬ volatile?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = const(t)
⊃ uninterpreted_data_type?(uidt(dt_cv_float(typ)))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_float(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC18.
Q.E.D.

C.44.117 Cpp_Types.uidt_TCC19

Terse proof for `uidt_TCC19`.

`uidt_TCC19:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
non_bool_integral_enum?(t) ∧
¬ volatile?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = const(t)
⊃ cv(non_bool_integral_enum?)(typ)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC19`.
Q.E.D.

C.44.118 Cpp_Types.uidt_TCC20

Terse proof for `uidt_TCC20`.

`uidt_TCC20:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
non_bool_integral_enum?(t) ∧
¬ volatile?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = const(t)
⊃ uninterpreted_data_type?(uidt(dt(typ)))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt(typ!1),
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC20`.
Q.E.D.

C.44.119 Cpp_Types.uidt_TCC21

Terse proof for `uidt_TCC21`.

`uidt_TCC21:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
¬ volatile?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = const(t)
⊃ ¬ (floating_point?(t) ∧ non_bool_integral_enum?(t))

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC21`.

Q.E.D.

C.44.120 Cpp_Types.uidt_TCC22

Terse proof for `uidt_TCC22`.

`uidt_TCC22:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
¬ volatile?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = const(t)
⊃ floating_point?(t) ∨ non_bool_integral_enum?(t)

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Instantiating the top quantifier in -1 with the terms: (typ!1),
Expanding the definition of subterm,
Applying disjunctive simplification to flatten sequent,
Keeping (-3 -17 -21 -23 -24 -25 -27 -29 1 2 3 4 5 6 7) and hiding *,
Replacing using formula -8,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC22`.
Q.E.D.

C.44.121 Cpp_Types.uidt_TCC23

Terse proof for `uidt_TCC23`.

`uidt_TCC23:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
t = bool ∧ typ = volatile(t) ⊃ uninterpreted_data_type?(uidt(dt_bool))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_bool,
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC23`.
Q.E.D.

C.44.122 Cpp_Types.uidt_TCC24

Terse proof for `uidt_TCC24`.

`uidt_TCC24:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = volatile(t) ⊃ (∀ (t_1: Cpp_Type_): t = pointer(t_1) ⊃ cv(pointer?)(typ))

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC24`.

Q.E.D.

C.44.123 Cpp_Types.uidt_TCC25

Terse proof for `uidt_TCC25`.

`uidt_TCC25`:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = volatile(t) ⊃
(∀ (t_1: Cpp_Type_):
t = pointer(t_1) ⊃ uninterpreted_data_type?(uidt(dt_cv_pointer(typ))))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_pointer(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC25`.
Q.E.D.

C.44.124 Cpp_Types.uidt_TCC26

Terse proof for `uidt_TCC26`.

`uidt_TCC26`:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = volatile(t) ⊃
(∀ (c: (class?), t_1: Cpp_Type_):
t = pointer_to_member(c, t_1) ⊃ cv(pointer_to_member?)(typ))

Repeatedly Skolemizing and flattening,
Hiding formulas: -2,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC26`.
Q.E.D.

C.44.125 Cpp_Types.uidt_TCC27

Terse proof for `uidt_TCC27`.

`uidt_TCC27`:

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
typ = volatile(t) ⊃
(∀ (c: (class?), t_1: Cpp_Type_):
t = pointer_to_member(c, t_1) ⊃ uninterpreted_data_type?(uidt(dt_cv_ptm(typ))))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_ptm(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC27`.
Q.E.D.

C.44.126 Cpp_Types.uidt_TCC28

Terse proof for `uidt_TCC28`.

`uidt_TCC28`:

```
{1}  ∀ (typ: Cpp_Type, t: Cpp_Type_):
       typ = volatile(t) ⊃
        (∀ (t1: Cpp_Type_, bo: nat, s: posnat):
             t = bitfield(t1, bo, s) ⊃ cv(bitfield?)(typ))
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -3,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC28`.
Q.E.D.

C.44.127 Cpp_Types.uidt_TCC29

Terse proof for `uidt_TCC29`.

`uidt_TCC29`:

```
{1}  ∀ (typ: Cpp_Type, t: Cpp_Type_):
       typ = volatile(t) ⊃
        (∀ (t1: Cpp_Type_, bo: nat, s: posnat):
             t = bitfield(t1, bo, s) ⊃ uninterpreted_data_type?(uidt(dt_cv_bitfield(typ))))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_bitfield(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC29`.
Q.E.D.

C.44.128 Cpp_Types.uidt_TCC30

Terse proof for `uidt_TCC30`.

`uidt_TCC30`:

```
{1}  ∀ (typ: Cpp_Type, t: Cpp_Type_):
       floating_point?(t) ∧
        ¬ bitfield?(t) ∧
         ¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = volatile(t)
        ⊃ cv(floating_point?)(typ)
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC30`.
Q.E.D.

C.44.129 Cpp_Types.uidt_TCC31

Terse proof for `uidt_TCC31`.

`uidt_TCC31:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
floating_point?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = volatile(t)
⊃ uninterpreted_data_type?(uidt(dt_cv_float(typ)))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_float(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC31`.
Q.E.D.

C.44.130 Cpp_Types.uidt_TCC32

Terse proof for `uidt_TCC32`.

`uidt_TCC32:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
non_bool_integral_enum?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = volatile(t)
⊃ cv(non_bool_integral_enum?)(typ)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC32`.
Q.E.D.

C.44.131 Cpp_Types.uidt_TCC33

Terse proof for `uidt_TCC33`.

`uidt_TCC33:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
non_bool_integral_enum?(t) ∧
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = volatile(t)
⊃ uninterpreted_data_type?(uidt(dt(typ)))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt(typ!1),
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `uidt_TCC33`.
Q.E.D.

C.44.132 Cpp_Types.uidt_TCC34

Terse proof for `uidt_TCC34`.

`uidt_TCC34:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = volatile(t)
⊃ ¬ (floating_point?(t) ∧ non_bool_integral_enum?(t))

Repeatedly Skolemizing and flattening,

Keeping (-3 -4) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `uidt_TCC34`.

Q.E.D.

C.44.133 Cpp_Types.uidt_TCC35

Terse proof for `uidt_TCC35`.

`uidt_TCC35:`

{1} ∀ (typ: Cpp_Type, t: Cpp_Type_):
¬ bitfield?(t) ∧
¬ pointer_to_member?(t) ∧ ¬ pointer?(t) ∧ ¬ bool?(t) ∧ typ = volatile(t)
⊃ floating_point?(t) ∨ non_bool_integral_enum?(t)

Repeatedly Skolemizing and flattening,

Expanding the definition of Cpp_Type?,

Instantiating the top quantifier in -1 with the terms: (typ!1),

Expanding the definition of subterm,

Applying disjunctive simplification to flatten sequent,

Replacing using formula -29,

Keeping (-3 -17 -20 -22 -23 -24 -25 -27 1 2 3 4 5 6) and hiding *,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `uidt_TCC35`.

Q.E.D.

C.44.134 Cpp_Types.uidt_TCC36

Terse proof for `uidt_TCC36`.

uidt_TCC36:

{1} ∀ (typ: Cpp_Type):
floating_point?(typ) ∧
¬ volatile?(typ) ∧
¬ const?(typ) ∧
¬ bool?(typ) ∧
¬ bitfield?(typ) ∧
¬ pointer_to_member?(typ) ∧
¬ reference?(typ) ∧
¬ pointer?(typ) ∧
¬ union?(typ) ∧
¬ class?(typ) ∧ ¬ function?(typ) ∧ ¬ array?(typ) ∧ ¬ void?(typ)
⊃ cv(floating_point?)(typ)

Repeatedly Skolemizing and flattening,
Keeping (-2 13) and hiding *,
Expanding the definition of cv,
Expanding the definition of c,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC36.
Q.E.D.

C.44.135 Cpp_Types.uidt_TCC37

Terse proof for uidt_TCC37.

uidt_TCC37:

{1} ∀ (typ: Cpp_Type):
floating_point?(typ) ∧
¬ volatile?(typ) ∧
¬ const?(typ) ∧
¬ bool?(typ) ∧
¬ bitfield?(typ) ∧
¬ pointer_to_member?(typ) ∧
¬ reference?(typ) ∧
¬ pointer?(typ) ∧
¬ union?(typ) ∧
¬ class?(typ) ∧ ¬ function?(typ) ∧ ¬ array?(typ) ∧ ¬ void?(typ)
⊃ uninterpreted_data_type?(uidt(dt_cv_float(typ)))

Repeatedly Skolemizing and flattening,
Adding type constraints for dt_cv_float(typ!1),
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC37.
Q.E.D.

C.44.136 Cpp_Types.uidt_TCC38

Terse proof for uidt_TCC38.

uidt_TCC38:

```
{1}   ∀ (typ: Cpp_Type):
        non_bool_integral_enum?(typ) ∧
         ¬ volatile?(typ) ∧
          ¬ const?(typ) ∧
           ¬ bool?(typ) ∧
            ¬ bitfield?(typ) ∧
             ¬ pointer_to_member?(typ) ∧
              ¬ reference?(typ) ∧
               ¬ pointer?(typ) ∧
                ¬ union?(typ) ∧
                 ¬ class?(typ) ∧ ¬ function?(typ) ∧ ¬ array?(typ) ∧ ¬ void?(typ)
         ⊃ cv(non_bool_integral_enum?)(typ)
```

Repeatedly Skolemizing and flattening,
Expanding the definition of cv,
Expanding the definition of c,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC38.
Q.E.D.

C.44.137 Cpp_Types.uidt_TCC39

Terse proof for uidt_TCC39.

uidt_TCC39:

```
{1}   ∀ (typ: Cpp_Type):
        non_bool_integral_enum?(typ) ∧
         ¬ volatile?(typ) ∧
          ¬ const?(typ) ∧
           ¬ bool?(typ) ∧
            ¬ bitfield?(typ) ∧
             ¬ pointer_to_member?(typ) ∧
              ¬ reference?(typ) ∧
               ¬ pointer?(typ) ∧
                ¬ union?(typ) ∧
                 ¬ class?(typ) ∧ ¬ function?(typ) ∧ ¬ array?(typ) ∧ ¬ void?(typ)
         ⊃ uninterpreted_data_type?(uidt(dt(typ)))
```

Repeatedly Skolemizing and flattening,
Adding type constraints for dt(typ!1),
Expanding the definition of pod_data_type?,
Expanding the definition of interpreted_data_type?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_TCC39.
Q.E.D.

C.44.138 Cpp_Types.uidt_TCC40

Terse proof for uidt_TCC40.

`uidt_TCC40:`

{1} ∀ (typ: Cpp_Type):
¬ volatile?(typ) ∧
¬ const?(typ) ∧
¬ bool?(typ) ∧
¬ bitfield?(typ) ∧
¬ pointer_to_member?(typ) ∧
¬ reference?(typ) ∧
¬ pointer?(typ) ∧
¬ union?(typ) ∧
¬ class?(typ) ∧ ¬ function?(typ) ∧ ¬ array?(typ) ∧ ¬ void?(typ)
⊃ ¬ (floating_point?(typ) ∧ non_bool_integral_enum?(typ))

Repeatedly Skolemizing and flattening,
Keeping (-2 -3) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC40`.
Q.E.D.

C.44.139 Cpp_Types.uidt_TCC41

Terse proof for `uidt_TCC41`.

`uidt_TCC41:`

{1} ∀ (typ: Cpp_Type):
¬ volatile?(typ) ∧
¬ const?(typ) ∧
¬ bool?(typ) ∧
¬ bitfield?(typ) ∧
¬ pointer_to_member?(typ) ∧
¬ reference?(typ) ∧
¬ pointer?(typ) ∧
¬ union?(typ) ∧
¬ class?(typ) ∧ ¬ function?(typ) ∧ ¬ array?(typ) ∧ ¬ void?(typ)
⊃ floating_point?(typ) ∨ non_bool_integral_enum?(typ)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_TCC41`.
Q.E.D.

C.44.140 Cpp_Types.mod_float_TCC1

Terse proof for `mod_float_TCC1`.

`mod_float_TCC1:`

{1} ∃ (x: [Cpp_Subtype(cv(floating_point?)) → [extended_real → extended_real]]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (t: Cpp_Subtype(cv(floating_point?))): λ (e: extended_real): e),

which is trivially true.
This completes the proof of `mod_float_TCC1`.
Q.E.D.

C.44.141 Cpp_Types.value_bitmask_TCC1

Terse proof for `value_bitmask_TCC1`.
`value_bitmask_TCC1:`

```
{1}  ∀ (typ: Cpp_Subtype(cv(non_bool_integral_enum?))):
       ¬ (bool?(typ) ∨
            float?(typ) ∨
              double?(typ) ∨
                longdouble?(typ) ∨
                  void?(typ) ∨
                    array?(typ) ∨
                      function?(typ) ∨
                        pointer?(typ) ∨
                          reference?(typ) ∨
                            class?(typ) ∨ union?(typ) ∨ bitfield?(typ) ∨ pointer_to_member?(typ))
```

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Expanding the definition of cv,
Expanding the definition of c,
Expanding the definition of v,
Expanding the definition of non_bool_integral_enum?,
Expanding the definition of non_bool_integral?,
Expanding the definition of unsigned_integer?,
Expanding the definition of signed_integer?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `value_bitmask_TCC1`.
Q.E.D.

C.45 Proofs for Cpp_Verification (cpp-verification.pvs)

This theory contains no provable formal statements.

C.46 Proofs for Cpp_array (types.pvs)

C.46.1 Cpp_array.uidt_array_TCC1

Terse proof for `uidt_array_TCC1`.
`uidt_array_TCC1:`

```
{1}  ∃ (x: ⌊Cpp_Subtype(array?) → (uninterpreted_data_type?)⌋): TRUE
```

Instantiating the top quantifier in 1 with the terms: (λ (c: Cpp_Subtype(array?)): choose(uninterpreted_data_type?)),
we get 2 subgoals:

uidt_array_TCC1.1:

|
{1} TRUE

which is trivially true.
This completes the proof of uidt_array_TCC1.1.
uidt_array_TCC1.2:

|
{1} ∀ (c: Cpp_Subtype(array?)): nonempty?[Uninterpreted_data_type](uninterpreted_data_type?)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in -3 with the terms: ((# size := 0, valid? := LAMBDA (l: list[Byte], a: Address): FALSE #)),
Repeatedly Skolemizing and flattening,
This completes the proof of uidt_array_TCC1.2.
Q.E.D.

C.47 Proofs for Cpp_bitfield (types.pvs)

C.47.1 Cpp_bitfield.range_bitfield_TCC1

Terse proof for range_bitfield_TCC1.
range_bitfield_TCC1:

|
{1} ∃ (x: [Cpp_Subtype(bitfield?) → non_empty_finite_set[int]]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (b: Cpp_Subtype(bitfield?)): λ (i: int): i = 0),
we get 2 subgoals:
range_bitfield_TCC1.1:

|
{1} TRUE

which is trivially true.
This completes the proof of range_bitfield_TCC1.1.
range_bitfield_TCC1.2:

|
{1} ∀ (b: Cpp_Subtype(bitfield?)):
is_finite[int](λ (i: int): i = 0) ∧ ¬ empty?[int](λ (i: int): i = 0)

Repeatedly Skolemizing and flattening,
Hiding formulas: -1,
Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (i: int): i = 0)): 0),
which is trivially true.
This completes the proof of range_bitfield_TCC1.2.
Q.E.D.

C.47.2 Cpp_bitfield.bitfield_range_underlying_TCC1

Terse proof for `bitfield_range_underlying_TCC1`.

`bitfield_range_underlying_TCC1:`

{1} ∀ (*b*: Cpp_Subtype(bitfield?)):
array?(*b*) ∨
pointer?(*b*) ∨
reference?(*b*) ∨
bitfield?(*b*) ∨ enum?(*b*) ∨ pointer_to_member?(*b*) ∨ const?(*b*) ∨ volatile?(*b*)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `bitfield_range_underlying_TCC1`.
Q.E.D.

C.47.3 Cpp_bitfield.bitfield_range_underlying_TCC2

Terse proof for `bitfield_range_underlying_TCC2`.

`bitfield_range_underlying_TCC2:`

{1} ∀ (*b*: Cpp_Subtype(bitfield?)): enum?(typ(*b*)) ⊃ Cpp_Type?(typ(*b*))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bitfield_range_underlying_TCC2`.
Q.E.D.

C.47.4 Cpp_bitfield.bitfield_range_underlying_TCC3

Terse proof for `bitfield_range_underlying_TCC3`.

`bitfield_range_underlying_TCC3:`

{1} ∀ (*b*: Cpp_Subtype(bitfield?)): ¬ enum?(typ(*b*)) ⊃ non_bool_integral?(typ(*b*))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Expanding the definition of subterm,
Applying disjunctive simplification to flatten sequent,
Keeping (-16 -29 1 2) and hiding *,
Expanding the definition of bitfield_underlying_integral_or_enum_type?,
Expanding the definition of non_bool_integral_enum?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `bitfield_range_underlying_TCC3`.
Q.E.D.

C.47.5 Cpp_bitfield.dt_bitfield_TCC1

Terse proof for `dt_bitfield_TCC1`.

`dt_bitfield_TCC1:`

{1} ∃ (x_1: [b: Cpp_Subtype(bitfield?) → (interpreted_data_type?[((range_bitfield(b)))])]):
TRUE

Instantiating the top quantifier in 1 with the terms: (λ (b: Cpp_Subtype(bitfield?)): choose(interpreted_data_type?[((range_bitfield(b)))])),

we get 2 subgoals:

`dt_bitfield_TCC1.1:`

{1} TRUE

which is trivially true.

This completes the proof of `dt_bitfield_TCC1.1`.

`dt_bitfield_TCC1.2:`

{1} ∀ (b: Cpp_Subtype(bitfield?)):
nonempty?[Interpreted_data_type[((range_bitfield(b)))]]
(interpreted_data_type?[((range_bitfield(b)))])

Repeatedly Skolemizing and flattening,

Expanding the definition of nonempty?,

Expanding the definition of empty?,

Expanding the definition of member,

Using lemma dt_bitfield_exists,

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

This completes the proof of `dt_bitfield_TCC1.2`.

Q.E.D.

C.48 Proofs for Cpp_bool (types.pvs)

C.48.1 Cpp_bool.range_bool_TCC1

Terse proof for `range_bool_TCC1`.

`range_bool_TCC1:`

{1} is_finite[bool](fullset[bool]) ∧ ¬ empty?[bool](fullset[bool])

Trying repeated skolemization, instantiation, and if-lifting,

Instantiating the top quantifier in 1 with the terms: (2 LAMBDA (b: (fullset[bool])): IF b THEN 0 ELSE 1 ENDIF),

Repeatedly Skolemizing and flattening,

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `range_bool_TCC1`.

Q.E.D.

C.48.2 Cpp_bool.dt_bool_TCC1

Terse proof for `dt_bool_TCC1`.
`dt_bool_TCC1:`

```
{1}   ∃ (x: (pod_data_type?[bool])): TRUE
```

Rewriting using dt_bool_exists, matching in *,
This completes the proof of `dt_bool_TCC1`.
Q.E.D.

C.49 Proofs for Cpp_char (types.pvs)

C.49.1 Cpp_char.dt_char_TCC1

Terse proof for `dt_char_TCC1`.
`dt_char_TCC1:`

```
{1}   ∃ (x_1: (pod_data_type?[(range_char)])): TRUE
```

Rewriting using dt_char_exists, matching in *,
This completes the proof of `dt_char_TCC1`.
Q.E.D.

C.49.2 Cpp_char.value_bitmask_char_TCC1

Terse proof for `value_bitmask_char_TCC1`.
`value_bitmask_char_TCC1:`

```
{1}   ∃ (x_1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_char))}): TRUE
```

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_char_TCC1`.
Q.E.D.

C.49.3 Cpp_char.min_char

Terse proof for `min_char`.
`min_char:`

```
{1}   min(range_char) ≤ 0
```

Using lemma char_is_uchar_or_schar,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`min_char.1:`

```
{-1}   range_char = range_schar
{1}    min(range_char) ≤ 0
```

Replacing using formula -1,

Using lemma min_schar,
Using lemma dt_schar_bits,
Using lemma min_bits_per_byte,
Using lemma bits_per_byte_minimum,
Rewriting using dt_schar_size, matching in *,
Rewriting using dt_uchar_size, matching in *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `min_char.1`.
`min_char.2:`

{-1}	range_char = extend[int, nat, bool, FALSE](range_uchar)
{1}	min(range_char) ≤ 0

Using lemma min_bits_per_byte,
Using lemma bits_per_byte_minimum,
Using lemma binary_range_uchar,
Using lemma dt_uchar_bits,
Rewriting using dt_uchar_size, matching in *,
Using lemma expt_ge1,
we get 2 subgoals:
`min_char.2.1:`

{-1}	2 ^ (max_value_bits_uchar − 8) ≥ 1
{-2}	max_value_bits_uchar = 1 × bits_per_byte
{-3}	range_uchar(0) ≡ 0 ≤ max(range_uchar)
{-4}	bits_per_byte ≥ min_bits_per_byte
{-5}	min_bits_per_byte = 8
{-6}	range_char = extend[int, nat, bool, FALSE](range_uchar)
{1}	min(range_char) ≤ 0

Trying repeated skolemization, instantiation, and if-lifting,
Keeping (-3 1) and hiding *,
Adding type constraints for min(extend[int, nat, bool, FALSE](range_uchar)),
Instantiating the top quantifier in -2 with the terms: (0),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `min_char.2.1`.
`min_char.2.2:`

{-1}	max_value_bits_uchar = 1 × bits_per_byte
{-2}	range_uchar(0) ≡ 0 ≤ max(range_uchar)
{-3}	bits_per_byte ≥ min_bits_per_byte
{-4}	min_bits_per_byte = 8
{-5}	range_char = extend[int, nat, bool, FALSE](range_uchar)
{1}	max_value_bits_uchar − 8 ≥ 0
{2}	min(range_char) ≤ 0

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `min_char.2.2`.
Q.E.D.

C.49.4 Cpp_char.max_char

Terse proof for `max_char`.

`max_char:`

{1}	max(range_char) $\geq$ 127

Using lemma char_is_uchar_or_schar,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`max_char.1:`

{-1}	range_char = range_schar
{1}	max(range_char) $\geq$ 127

Replacing using formula -1,
Using lemma max_schar,
Using lemma dt_schar_bits,
Using lemma min_bits_per_byte,
Using lemma bits_per_byte_minimum,
Rewriting using dt_schar_size, matching in *,
Rewriting using dt_uchar_size, matching in *,
Using lemma expt_ge1,
we get 2 subgoals:
`max_char.1.1:`

{-1}	2 ^ (max_value_bits_schar − 7) $\geq$ 1
{-2}	bits_per_byte $\geq$ min_bits_per_byte
{-3}	min_bits_per_byte = 8
{-4}	max_value_bits_schar $\geq$ 1 × bits_per_byte − 1
{-5}	max(range_schar) $\geq$ (2 ^ max_value_bits_schar) − 1
{-6}	range_char = range_schar
{1}	max(range_schar) $\geq$ 127

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `max_char.1.1`.
`max_char.1.2:`

{-1}	bits_per_byte $\geq$ min_bits_per_byte
{-2}	min_bits_per_byte = 8
{-3}	max_value_bits_schar $\geq$ 1 × bits_per_byte − 1
{-4}	max(range_schar) $\geq$ (2 ^ max_value_bits_schar) − 1
{-5}	range_char = range_schar
{1}	max_value_bits_schar − 7 $\geq$ 0
{2}	max(range_schar) $\geq$ 127

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `max_char.1.2`.
`max_char.2:`

{-1}	range_char = extend[int, nat, bool, FALSE](range_uchar)
{1}	max(range_char) $\geq$ 127

Using lemma max_uchar,
Using lemma dt_uchar_bits,
Using lemma min_bits_per_byte,
Using lemma bits_per_byte_minimum,
Rewriting using dt_uchar_size, matching in *,
Using lemma expt_ge1,

we get 2 subgoals:
`max_char.2.1:`

{-1}	$2 \hat{} (\text{max\_value\_bits\_uchar} - 8) \geq 1$
{-2}	$\text{bits\_per\_byte} \geq \text{min\_bits\_per\_byte}$
{-3}	$\text{min\_bits\_per\_byte} = 8$
{-4}	$\text{max\_value\_bits\_uchar} = 1 \times \text{bits\_per\_byte}$
{-5}	$\max(\text{range\_uchar}) \geq (2 \hat{} \text{max\_value\_bits\_uchar}) - 1$
{-6}	$\text{range\_char} = \text{extend}[\text{int, nat, bool, FALSE}](\text{range\_uchar})$
{1}	$\max(\text{range\_char}) \geq 127$

Replacing using formula -6,
Trying repeated skolemization, instantiation, and if-lifting,
Adding type constraints for max(extend[int, nat, bool, FALSE](range_uchar)),
Instantiating the top quantifier in -2 with the terms: (127),
Expanding the definition of extend,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Rewriting using binary_range_uchar, matching in * where n gets 127,
This completes the proof of `max_char.2.1`.
`max_char.2.2:`

{-1}	$\text{bits\_per\_byte} \geq \text{min\_bits\_per\_byte}$
{-2}	$\text{min\_bits\_per\_byte} = 8$
{-3}	$\text{max\_value\_bits\_uchar} = 1 \times \text{bits\_per\_byte}$
{-4}	$\max(\text{range\_uchar}) \geq (2 \hat{} \text{max\_value\_bits\_uchar}) - 1$
{-5}	$\text{range\_char} = \text{extend}[\text{int, nat, bool, FALSE}](\text{range\_uchar})$
{1}	$\text{max\_value\_bits\_uchar} - 8 \geq 0$
{2}	$\max(\text{range\_char}) \geq 127$

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `max_char.2.2`.
Q.E.D.

C.49.5 Cpp_char.char_binary

Terse proof for `char_binary`.
`char_binary:`

{1}	$\forall (i\text{: int}): \text{range\_char}(i) \equiv (\min(\text{range\_char}) \leq i \wedge i \leq \max(\text{range\_char}))$

Installing automatic rewrites from: extend
Repeatedly Skolemizing and flattening,
Using lemma char_is_uchar_or_schar,
Splitting conjunctions,
we get 2 subgoals:
`char_binary.1:`

{-1}	$\text{range\_char} = \text{range\_schar}$
{-2}	$\text{integer\_pred}(i')$
{1}	$\text{range\_char}(i') \equiv (\min(\text{range\_char}) \leq i' \wedge i' \leq \max(\text{range\_char}))$

Replacing using formula -1,
Using lemma schar_binary,
This completes the proof of `char_binary.1`.

`char_binary.2:`

{-1}	range_char = extend[int, nat, bool, FALSE](range_uchar)	
{-2}	integer_pred(i')	
{1}	range_char(i') ≡ (min(range_char) ≤ i' ∧ i' ≤ max(range_char))	

Replacing using formula -1,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 3 subgoals:

`char_binary.2.1:`

{-1}	range_char = extend[int, nat, bool, FALSE](range_uchar)	
{-2}	integer_pred(i')	
{-3}	extend[int, nat, bool, FALSE](range_uchar)(i')	
{1}	i' ≤ max(extend[int, nat, bool, FALSE](range_uchar))	

Adding type constraints for max(extend[int, nat, bool, FALSE](range_uchar)),

Instantiating the top quantifier in -2 with the terms: (i!1),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `char_binary.2.1`.

`char_binary.2.2:`

{-1}	range_char = extend[int, nat, bool, FALSE](range_uchar)	
{-2}	integer_pred(i')	
{-3}	extend[int, nat, bool, FALSE](range_uchar)(i')	
{1}	min(extend[int, nat, bool, FALSE](range_uchar)) ≤ i'	

Adding type constraints for min(extend[int, nat, bool, FALSE](range_uchar)),

Instantiating the top quantifier in -2 with the terms: (i!1),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `char_binary.2.2`.

`char_binary.2.3:`

{-1}	range_char = extend[int, nat, bool, FALSE](range_uchar)	
{-2}	integer_pred(i')	
{-3}	min(extend[int, nat, bool, FALSE](range_uchar)) ≤ i'	
{-4}	i' ≤ max(extend[int, nat, bool, FALSE](range_uchar))	
{1}	extend[int, nat, bool, FALSE](range_uchar)(i')	

Adding type constraints for max(extend[int, nat, bool, FALSE](range_uchar)),

Adding type constraints for min(extend[int, nat, bool, FALSE](range_uchar)),

Using lemma binary_range_uchar,

we get 2 subgoals:

`char_binary.2.3.1:`

```
{-1}  range_uchar(i') ≡ i' ≤ max(range_uchar)
{-2}  extend[int, nat, bool, FALSE]
        (range_uchar)(min(extend[int, nat, bool, FALSE](range_uchar)))
{-3}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          min(extend[int, nat, bool, FALSE](range_uchar)) ≤ x
{-4}  extend[int, nat, bool, FALSE]
        (range_uchar)(max(extend[int, nat, bool, FALSE](range_uchar)))
{-5}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          x ≤ max(extend[int, nat, bool, FALSE](range_uchar))
{-6}  range_char = extend[int, nat, bool, FALSE](range_uchar)
{-7}  integer_pred(i')
{-8}  min(extend[int, nat, bool, FALSE](range_uchar)) ≤ i'
{-9}  i' ≤ max(extend[int, nat, bool, FALSE](range_uchar))
-------------------------------------------------------------
 {1}  extend[int, nat, bool, FALSE](range_uchar)(i')
```

Using lemma binary_range_uchar,

we get 2 subgoals:

`char_binary.2.3.1.1:`

```
{-1}  range_uchar(max(extend[int, nat, bool, FALSE](range_uchar))) ≡
        max(extend[int, nat, bool, FALSE](range_uchar)) ≤ max(range_uchar)
{-2}  range_uchar(i') ≡ i' ≤ max(range_uchar)
{-3}  extend[int, nat, bool, FALSE]
        (range_uchar)(min(extend[int, nat, bool, FALSE](range_uchar)))
{-4}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          min(extend[int, nat, bool, FALSE](range_uchar)) ≤ x
{-5}  extend[int, nat, bool, FALSE]
        (range_uchar)(max(extend[int, nat, bool, FALSE](range_uchar)))
{-6}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          x ≤ max(extend[int, nat, bool, FALSE](range_uchar))
{-7}  range_char = extend[int, nat, bool, FALSE](range_uchar)
{-8}  integer_pred(i')
{-9}  min(extend[int, nat, bool, FALSE](range_uchar)) ≤ i'
{-10} i' ≤ max(extend[int, nat, bool, FALSE](range_uchar))
-------------------------------------------------------------
 {1}  extend[int, nat, bool, FALSE](range_uchar)(i')
```

Expanding the definition of extend,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `char_binary.2.3.1.1`.

`char_binary.2.3.1.2`:

```
{-1}  range_uchar(i') ≡ i' ≤ max(range_uchar)
{-2}  extend[int, nat, bool, FALSE]
        (range_uchar)(min(extend[int, nat, bool, FALSE](range_uchar)))
{-3}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          min(extend[int, nat, bool, FALSE](range_uchar)) ≤ x
{-4}  extend[int, nat, bool, FALSE]
        (range_uchar)(max(extend[int, nat, bool, FALSE](range_uchar)))
{-5}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          x ≤ max(extend[int, nat, bool, FALSE](range_uchar))
{-6}  range_char = extend[int, nat, bool, FALSE](range_uchar)
{-7}  integer_pred(i')
{-8}  min(extend[int, nat, bool, FALSE](range_uchar)) ≤ i'
{-9}  i' ≤ max(extend[int, nat, bool, FALSE](range_uchar))
-------------------------------------------------------------
{1}   max[int, restrict[[real, real], [int, int], boolean[(≤)]]
        (extend[int, nat, bool, FALSE](range_uchar))
        ≥ 0
{2}   extend[int, nat, bool, FALSE](range_uchar)(i')
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `char_binary.2.3.1.2`.
`char_binary.2.3.2`:

```
{-1}  extend[int, nat, bool, FALSE]
        (range_uchar)(min(extend[int, nat, bool, FALSE](range_uchar)))
{-2}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          min(extend[int, nat, bool, FALSE](range_uchar)) ≤ x
{-3}  extend[int, nat, bool, FALSE]
        (range_uchar)(max(extend[int, nat, bool, FALSE](range_uchar)))
{-4}  ∀ (x: int):
        extend[int, nat, bool, FALSE](range_uchar)(x) ⊃
          x ≤ max(extend[int, nat, bool, FALSE](range_uchar))
{-5}  range_char = extend[int, nat, bool, FALSE](range_uchar)
{-6}  integer_pred(i')
{-7}  min(extend[int, nat, bool, FALSE](range_uchar)) ≤ i'
{-8}  i' ≤ max(extend[int, nat, bool, FALSE](range_uchar))
-------------------------------------------------------------
{1}   i' ≥ 0
{2}   extend[int, nat, bool, FALSE](range_uchar)(i')
```

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `char_binary.2.3.2`.
Q.E.D.

C.50 Proofs for Cpp_class (types.pvs)

C.50.1 Cpp_class.uidt_class_TCC1

Terse proof for `uidt_class_TCC1`.

uidt_class_TCC1:

{1} ∃ (x: [Cpp_Subtype(class?) → {uidt: (uninterpreted_data_type?) | size(uidt) > 0}]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (c: Cpp_Subtype(class?)): choose({uidt: (uninterpreted_data_type?) | size(uidt) > 0})),
we get 2 subgoals:
uidt_class_TCC1.1:

{1} TRUE

which is trivially true.
This completes the proof of uidt_class_TCC1.1.
uidt_class_TCC1.2:

{1} ∀ (c: Cpp_Subtype(class?)):
nonempty?[(uninterpreted_data_type?)]
({uidt: (uninterpreted_data_type?) | size(uidt) > 0})

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in -3 with the terms: ((# size := 1, valid? := LAMBDA (l: list[Byte], a: Address): FALSE #)),
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of uidt_class_TCC1.2.
Q.E.D.

C.51 Proofs for Cpp_const_volatile (types.pvs)

C.51.1 Cpp_const_volatile.dt_volatile_TCC1

Terse proof for dt_volatile_TCC1.
dt_volatile_TCC1:

{1} ∃ (x: [(interpreted_data_type?[Data]) → (interpreted_data_type?[Data])]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (idt: (interpreted_data_type?[Data])): idt),
which is trivially true.
This completes the proof of dt_volatile_TCC1.
Q.E.D.

C.52 Proofs for Cpp_double (types.pvs)

C.52.1 Cpp_double.dt_double_TCC1

Terse proof for dt_double_TCC1.
dt_double_TCC1:

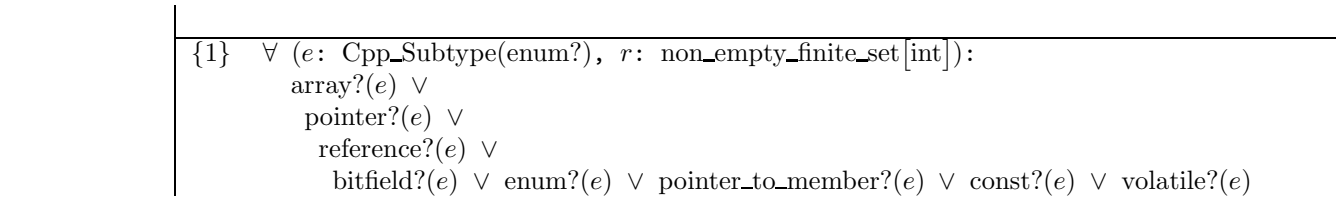
{1} ∃ (x_1: (pod_data_type?[(range_double)])): TRUE

Rewriting using dt_double_exists, matching in *,
This completes the proof of `dt_double_TCC1`.
Q.E.D.

C.53 Proofs for Cpp_enum (types.pvs)

C.53.1 Cpp_enum.valid_range?_TCC1

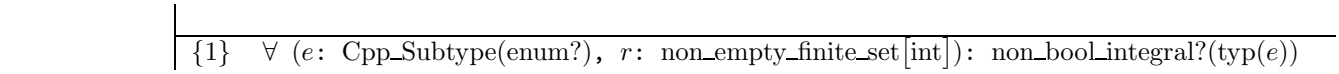
Terse proof for `valid_range?_TCC1`.
`valid_range?_TCC1:`



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `valid_range?_TCC1`.
Q.E.D.

C.53.2 Cpp_enum.valid_range?_TCC2

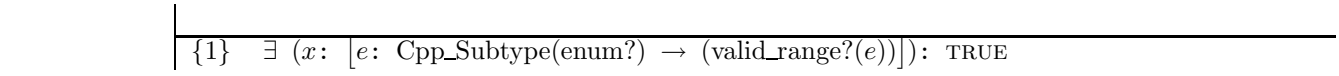
Terse proof for `valid_range?_TCC2`.
`valid_range?_TCC2:`



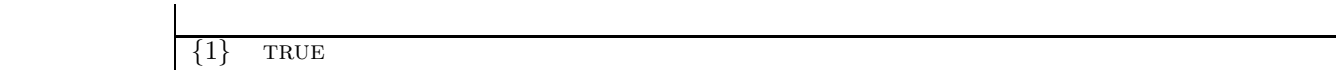
Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Expanding the definition of subterm,
Expanding the definition of enum_underlying_integral?,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `valid_range?_TCC2`.
Q.E.D.

C.53.3 Cpp_enum.range_enum_TCC1

Terse proof for `range_enum_TCC1`.
`range_enum_TCC1:`



Instantiating the top quantifier in 1 with the terms: (λ (e: Cpp_Subtype(enum?)): range_integral(typ(e))),
we get 3 subgoals:
`range_enum_TCC1.1:`



which is trivially true.
This completes the proof of `range_enum_TCC1.1`.
`range_enum_TCC1.2`:

{1} ∀ (e: Cpp_Subtype(enum?)): valid_range?(e)(range_integral(typ(e)))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Expanding the definition of subterm,
Applying disjunctive simplification to flatten sequent,
Keeping (-18 -19 1) and hiding *,
Expanding the definition of enum_underlying_integral?,
Expanding the definition of enum_constants?,
Expanding the definition of valid_range?,
Rewriting using subset_reflexive, matching in *,
This completes the proof of `range_enum_TCC1.2`.
`range_enum_TCC1.3`:

{1} ∀ (e: Cpp_Subtype(enum?)): non_bool_integral?(typ(e))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Expanding the definition of subterm,
Applying disjunctive simplification to flatten sequent,
Keeping (-18 1) and hiding *,
Expanding the definition of enum_underlying_integral?,
which is trivially true.
This completes the proof of `range_enum_TCC1.3`.
Q.E.D.

C.53.4 Cpp_enum.dt_enum_TCC1

Terse proof for `dt_enum_TCC1`.
`dt_enum_TCC1`:

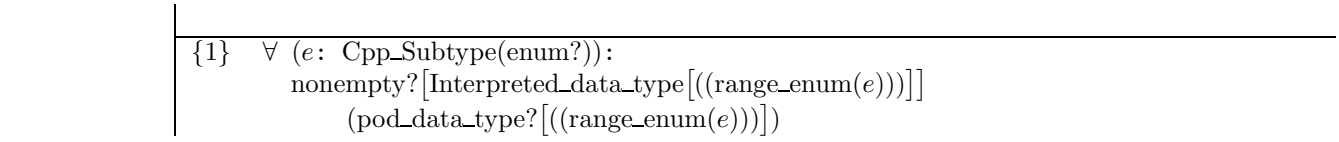
{1} ∃ (x_1: [e: Cpp_Subtype(enum?) → (pod_data_type?[((range_enum(e)))])]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (e: Cpp_Subtype(enum?)): choose(pod_data_type?[((range_enum(e)))])),
we get 2 subgoals:
`dt_enum_TCC1.1`:

{1} TRUE

which is trivially true.
This completes the proof of `dt_enum_TCC1.1`.

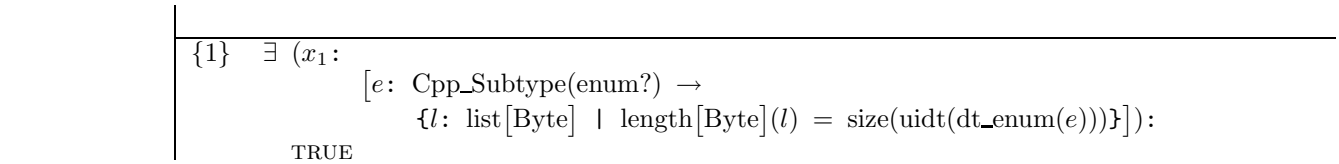
dt_enum_TCC1.2:



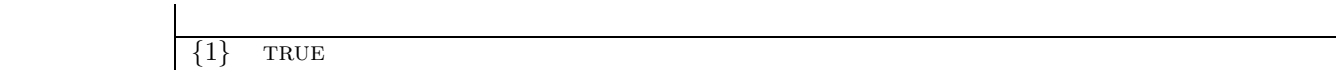
Repeatedly Skolemizing and flattening,
Expanding the definition of nonempty?,
Expanding the definition of empty?,
Expanding the definition of member,
Using lemma dt_enum_exists,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
This completes the proof of dt_enum_TCC1.2.
Q.E.D.

C.53.5 Cpp_enum.value_bitmask_enum_TCC1

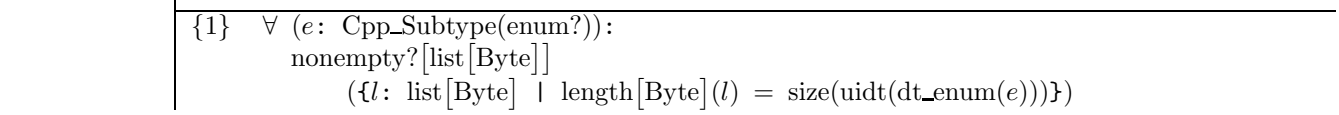
Terse proof for value_bitmask_enum_TCC1.
value_bitmask_enum_TCC1:



Instantiating the top quantifier in 1 with the terms: (λ (e: Cpp_Subtype(enum?)): choose({l: list[Byte] | length[Byte](l) = size(uidt(dt_enum(e)))})),
we get 2 subgoals:
value_bitmask_enum_TCC1.1:



which is trivially true.
This completes the proof of value_bitmask_enum_TCC1.1.
value_bitmask_enum_TCC1.2:



Repeatedly Skolemizing and flattening,
Expanding the definition of nonempty?,
Expanding the definition of empty?,
Expanding the definition of member,
Using lemma list_all_length[Byte],
Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -5 with the terms: (l!1),
which is trivially true.
This completes the proof of value_bitmask_enum_TCC1.2.
Q.E.D.

C.53.6 Cpp_enum.enum_size_TCC1

Terse proof for `enum_size_TCC1`.

`enum_size_TCC1:`

{1} ∀ (e: Cpp_Subtype(enum?)):
array?(e) ∨
pointer?(e) ∨
reference?(e) ∨
bitfield?(e) ∨ enum?(e) ∨ pointer_to_member?(e) ∨ const?(e) ∨ volatile?(e)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `enum_size_TCC1`.
Q.E.D.

C.53.7 Cpp_enum.enum_size_TCC2

Terse proof for `enum_size_TCC2`.

`enum_size_TCC2:`

{1} ∀ (e: Cpp_Subtype(enum?)): non_bool_integral?(typ(e))

Repeatedly Skolemizing and flattening,
Expanding the definition of Cpp_Type?,
Instantiating quantified variables,
Expanding the definition of subterm,
Applying disjunctive simplification to flatten sequent,
Keeping (-18 -27 1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `enum_size_TCC2`.
Q.E.D.

C.54 Proofs for Cpp_float (types.pvs)

C.54.1 Cpp_float.range_float_TCC1

Terse proof for `range_float_TCC1`.

`range_float_TCC1:`

{1} ∃ (x: non_empty_finite_set[extended_real]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (n: extended_real): $n = 0$),
we get 2 subgoals:

`range_float_TCC1.1:`

{1} TRUE

which is trivially true.
This completes the proof of `range_float_TCC1.1`.

`range_float_TCC1.2`:

{1} is_finite[extended_real](λ (n: extended_real): n = 0) ∧
¬ empty?[extended_real](λ (n: extended_real): n = 0)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: extended_real): n = 0)): 0),
which is trivially true.
This completes the proof of `range_float_TCC1.2`.
Q.E.D.

C.54.2 Cpp_float.dt_float_TCC1

Terse proof for `dt_float_TCC1`.
`dt_float_TCC1`:

{1} ∃ (x_1: (pod_data_type?[(range_float)])): TRUE

Rewriting using dt_float_exists, matching in *,
This completes the proof of `dt_float_TCC1`.
Q.E.D.

C.55 Proofs for Cpp_function (types.pvs)

C.55.1 Cpp_function.uidt_function_TCC1

Terse proof for `uidt_function_TCC1`.
`uidt_function_TCC1`:

{1} ∀ (f: Cpp_Subtype(function?)):
uninterpreted_data_type?((#size := 0, valid? := λ (l: list[Byte], a: Address): FALSE#))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_function_TCC1`.
Q.E.D.

C.55.2 Cpp_function.dt_vtable_TCC1

Terse proof for `dt_vtable_TCC1`.
`dt_vtable_TCC1`:

{1} ∃ (x_1:
[c: Cpp_Subtype(class?) →
(interpreted_data_type?[((singleton[Vtable](vtable(c))))])]):
TRUE

Instantiating the top quantifier in 1 with the terms: (λ (c: Cpp_Subtype(class?)): choose(interpreted_data_type?[((singleton[Vtable](vtable(c))))])),
we get 2 subgoals:

dt_vtable_TCC1.1:

{1} TRUE

which is trivially true.
This completes the proof of dt_vtable_TCC1.1.
dt_vtable_TCC1.2:

{1} ∀ (c: Cpp_Subtype(class?)):
nonempty?[Interpreted_data_type[((singleton[Vtable](vtable(c))))]]
(interpreted_data_type?[((singleton[Vtable](vtable(c))))])

Repeatedly Skolemizing and flattening,
Expanding the definition of nonempty?,
Expanding the definition of empty?,
Expanding the definition of member,
Using lemma vtable_idt_exists,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
This completes the proof of dt_vtable_TCC1.2.
Q.E.D.

C.56 Proofs for Cpp_int (types.pvs)

C.56.1 Cpp_int.range_int_TCC1

Terse proof for range_int_TCC1.
range_int_TCC1:

{1} ∃ (x: non_empty_finite_set[int]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (n: int): n = 0),
we get 2 subgoals:
range_int_TCC1.1:

{1} TRUE

which is trivially true.
This completes the proof of range_int_TCC1.1.
range_int_TCC1.2:

{1} is_finite[int](λ (n: int): n = 0) ∧ ¬ empty?[int](λ (n: int): n = 0)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: int): n = 0)): 0),
which is trivially true.
This completes the proof of range_int_TCC1.2.
Q.E.D.

C.56.2 Cpp_int.dt_int_TCC1

Terse proof for `dt_int_TCC1`.
`dt_int_TCC1:`

|
|---
| {1} ∃ (x_1: (pod_data_type?[(range_int)])): TRUE

Rewriting using dt_int_exists, matching in *,
This completes the proof of `dt_int_TCC1`.
Q.E.D.

C.56.3 Cpp_int.value_bitmask_int_TCC1

Terse proof for `value_bitmask_int_TCC1`.
`value_bitmask_int_TCC1:`

|
|---
| {1} ∃ (x_1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_int))}): TRUE

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_int_TCC1`.
Q.E.D.

C.57 Proofs for Cpp_long (types.pvs)

C.57.1 Cpp_long.range_long_TCC1

Terse proof for `range_long_TCC1`.
`range_long_TCC1:`

|
|---
| {1} ∃ (x: non_empty_finite_set[int]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (n: int): $n = 0$),
we get 2 subgoals:
`range_long_TCC1.1:`

|
|---
| {1} TRUE

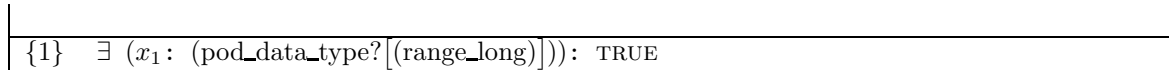
which is trivially true.
This completes the proof of `range_long_TCC1.1`.
`range_long_TCC1.2:`

|
|---
| {1} is_finite[int](λ (n: int): $n = 0$) $\wedge$ $\neg$ empty?[int](λ (n: int): $n = 0$)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: int): n = 0)): 0),
which is trivially true.
This completes the proof of `range_long_TCC1.2`.
Q.E.D.

C.57.2 Cpp_long.dt_long_TCC1

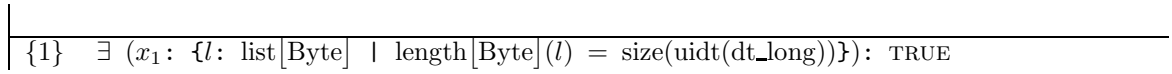
Terse proof for `dt_long_TCC1`.
`dt_long_TCC1`:



Rewriting using dt_long_exists, matching in *,
This completes the proof of `dt_long_TCC1`.
Q.E.D.

C.57.3 Cpp_long.value_bitmask_long_TCC1

Terse proof for `value_bitmask_long_TCC1`.
`value_bitmask_long_TCC1`:

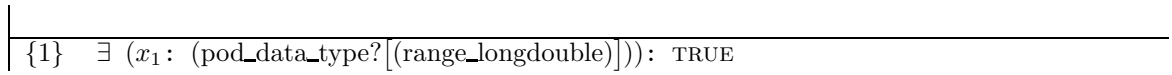


Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_long_TCC1`.
Q.E.D.

C.58 Proofs for Cpp_longdouble (types.pvs)

C.58.1 Cpp_longdouble.dt_longdouble_TCC1

Terse proof for `dt_longdouble_TCC1`.
`dt_longdouble_TCC1`:

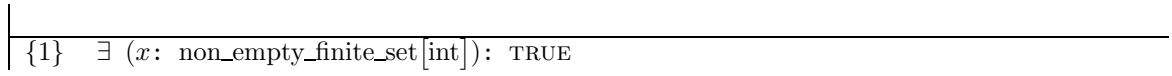


Rewriting using dt_longdouble_exists, matching in *,
This completes the proof of `dt_longdouble_TCC1`.
Q.E.D.

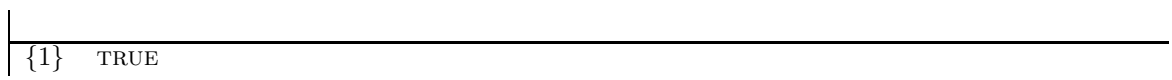
C.59 Proofs for Cpp_longlong (types.pvs)

C.59.1 Cpp_longlong.range_longlong_TCC1

Terse proof for `range_longlong_TCC1`.
`range_longlong_TCC1`:



Instantiating the top quantifier in 1 with the terms: (λ (n: int): n = 0),
we get 2 subgoals:
`range_longlong_TCC1.1`:



which is trivially true.
This completes the proof of `range_longlong_TCC1.1`.
`range_longlong_TCC1.2`:

{1} is_finite[int](λ (n: int): n = 0) ∧ ¬ empty?[int](λ (n: int): n = 0)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: int): n = 0)): 0),
which is trivially true.
This completes the proof of `range_longlong_TCC1.2`.
Q.E.D.

C.59.2 Cpp_longlong.dt_longlong_TCC1

Terse proof for `dt_longlong_TCC1`.
`dt_longlong_TCC1`:

{1} ∃ (x1: (pod_data_type?[(range_longlong)])): TRUE

Rewriting using dt_longlong_exists, matching in *,
This completes the proof of `dt_longlong_TCC1`.
Q.E.D.

C.59.3 Cpp_longlong.value_bitmask_longlong_TCC1

Terse proof for `value_bitmask_longlong_TCC1`.
`value_bitmask_longlong_TCC1`:

{1} ∃ (x1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_longlong))}): TRUE

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_longlong_TCC1`.
Q.E.D.

C.60 Proofs for Cpp_pointer (types.pvs)

C.60.1 Cpp_pointer.dt_pointer_TCC1

Terse proof for `dt_pointer_TCC1`.
`dt_pointer_TCC1`:

{1} ∃ (x1: [p: Cpp_Subtype(pointer?) → (pod_data_type?[((range_pointer(p)))])]): TRUE

Using lemma dt_pointer_exists,
Instantiating the top quantifier in 1 with the terms: (LAMBDA (p: Cpp_Subtype(pointer?)): choose(pod_data_type?[((range_pointer(p)))])),
we get 2 subgoals:

dt_pointer_TCC1.1:

{-1} ∀ (p: Cpp_Subtype(pointer?)):
∃ (dt: (pod_data_type?[((range_pointer(p)))])): TRUE

{1} TRUE

which is trivially true.
This completes the proof of dt_pointer_TCC1.1.
dt_pointer_TCC1.2:

{-1} ∀ (p: Cpp_Subtype(pointer?)):
∃ (dt: (pod_data_type?[((range_pointer(p)))])): TRUE

{1} ∀ (p: Cpp_Subtype(pointer?)):
nonempty?[Interpreted_data_type[((range_pointer(p)))]]
(pod_data_type?[((range_pointer(p)))])

Repeatedly Skolemizing and flattening,
Expanding the definition of nonempty?,
Expanding the definition of empty?,
Expanding the definition of member,
Instantiating quantified variables,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
This completes the proof of dt_pointer_TCC1.2.
Q.E.D.

C.60.2 Cpp_pointer.pointers_to_layout_compatible_range_TCC1

Terse proof for pointers_to_layout_compatible_range_TCC1.
pointers_to_layout_compatible_range_TCC1:

{1} ∀ (p_1, p_2: Cpp_Subtype(pointer?)):
array?(p_1) ∨
pointer?(p_1) ∨
reference?(p_1) ∨
bitfield?(p_1) ∨ enum?(p_1) ∨ pointer_to_member?(p_1) ∨ const?(p_1) ∨ volatile?(p_1)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pointers_to_layout_compatible_range_TCC1.
Q.E.D.

C.60.3 Cpp_pointer.pointers_to_layout_compatible_range_TCC2

Terse proof for pointers_to_layout_compatible_range_TCC2.
pointers_to_layout_compatible_range_TCC2:

{1} ∀ (p_1, p_2: Cpp_Subtype(pointer?)): Cpp_Type?(typ(p_1))

Repeatedly Skolemizing and flattening,
Keeping (-1 1) and hiding *,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,

Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pointers_to_layout_compatible_range_TCC2`.
Q.E.D.

C.60.4 Cpp_pointer.pointers_to_layout_compatible_range_TCC3

Terse proof for `pointers_to_layout_compatible_range_TCC3`.
`pointers_to_layout_compatible_range_TCC3`:

{1} ∀ (p_1, p_2: Cpp_Subtype(pointer?)):
array?(p_2) ∨
pointer?(p_2) ∨
reference?(p_2) ∨
bitfield?(p_2) ∨ enum?(p_2) ∨ pointer_to_member?(p_2) ∨ const?(p_2) ∨ volatile?(p_2)

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pointers_to_layout_compatible_range_TCC3`.
Q.E.D.

C.60.5 Cpp_pointer.pointers_to_layout_compatible_range_TCC4

Terse proof for `pointers_to_layout_compatible_range_TCC4`.
`pointers_to_layout_compatible_range_TCC4`:

{1} ∀ (p_1, p_2: Cpp_Subtype(pointer?)): Cpp_Type?(typ(p_2))

Repeatedly Skolemizing and flattening,
Keeping (-3 1) and hiding *,
Expanding the definition of Cpp_Type?,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Expanding the definition of subterm,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pointers_to_layout_compatible_range_TCC4`.
Q.E.D.

C.60.6 Cpp_pointer.pointers_to_layout_compatible_dt_TCC1

Terse proof for `pointers_to_layout_compatible_dt_TCC1`.
`pointers_to_layout_compatible_dt_TCC1`:

{1} ∀ (p_1, p_2: Cpp_Subtype(pointer?)):
layout_compatible?(typ(p_1), typ(p_2)) ⊃
(∀ (x: lift[Pointer_Base_Type]): range_pointer(p_2)(x) ≡ range_pointer(p_1)(x))

Repeatedly Skolemizing and flattening,
Using lemma pointers_to_layout_compatible_range,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pointers_to_layout_compatible_dt_TCC1`.
Q.E.D.

C.60.7 Cpp_pointer.void_pointer_char_pointer_dt_TCC1

Terse proof for `void_pointer_char_pointer_dt_TCC1`.

`void_pointer_char_pointer_dt_TCC1:`

{1} ∀ (p_1, p_2: Cpp_Subtype(pointer?)):
void?(typ(p_1)) ∧ char?(typ(p_2)) ⊃
(∀ (x: lift[Pointer_Base_Type]): range_pointer(p_2)(x) ≡ range_pointer(p_1)(x))

Repeatedly Skolemizing and flattening,
Using lemma void_pointer_char_pointer_range,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `void_pointer_char_pointer_dt_TCC1`.
Q.E.D.

C.60.8 Cpp_pointer.add_TCC1

Terse proof for `add_TCC1`.

`add_TCC1:`

{1} ∃ (x:
[ptyp: Cpp_Subtype(cv(pointer?)) →
[[(range_pointer(cv_base(ptyp))), int] →
(range_pointer(cv_base(ptyp)))]]):
TRUE

Instantiating the top quantifier in 1 with the terms: (λ (p: Cpp_Subtype(cv(pointer?))): λ (y: (range_pointer(cv_base(p))), z: int): y),
which is trivially true.
This completes the proof of `add_TCC1`.
Q.E.D.

C.60.9 Cpp_pointer.add_spec2_TCC1

Terse proof for `add_spec2_TCC1`.

`add_spec2_TCC1:`

{1} ∀ (i: int, ptyp: Cpp_Subtype(cv(pointer?)), ptr_val: (range_pointer(cv_base(ptyp)))):
not_null?(ptyp)(ptr_val) ⊃
up?[Memory_Address](address_of(ptyp)(add(ptyp)(ptr_val, i)))

Repeatedly Skolemizing and flattening,
Using lemma add_spec,
Using lemma address_of_spec,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `add_spec2_TCC1`.
Q.E.D.

C.60.10 Cpp_pointer.add_spec2_TCC2

Terse proof for `add_spec2_TCC2`.

`add_spec2_TCC2:`

{1} ∀ (ptyp: Cpp_Subtype(cv(pointer?)), ptr_val: (range_pointer(cv_base(ptyp)))):
not_null?(ptyp)(ptr_val) ⊃ up?[Memory_Address](address_of(ptyp)(ptr_val))

Repeatedly Skolemizing and flattening,

Using lemma address_of_spec,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `add_spec2_TCC2`.

Q.E.D.

C.60.11 Cpp_pointer.add_simplification

Terse proof for `add_simplification`.

`add_simplification:`

{1} ∀ (ptyp: Cpp_Subtype(cv(pointer?)), ptr_val: (range_pointer(cv_base(ptyp))),
i, j: int):
address_of(ptyp)(add(ptyp)(add(ptyp)(ptr_val, i), j)) =
address_of(ptyp)(add(ptyp)(ptr_val, $i + j$))

Repeatedly Skolemizing and flattening,

Case splitting on not_null?(ptyp!1)(ptr_val!1),

we get 2 subgoals:

`add_simplification.1:`

{-1} not_null?(ptyp′)(ptr_val′)
{-2} Cpp_Type?(ptyp′)
{-3} cv(pointer?)(ptyp′)
{-4} range_pointer(cv_base(ptyp′))(ptr_val′)
{-5} integer_pred(i')
{-6} integer_pred(j')

{1} address_of(ptyp′)(add(ptyp′)(add(ptyp′)(ptr_val′, i'), j')) =
address_of(ptyp′)(add(ptyp′)(ptr_val′, $i' + j'$))

Using lemma add_spec,

Using lemma add_spec,

Using lemma add_spec,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Using lemma add_spec2,

Using lemma add_spec2,

Using lemma add_spec2,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Replacing using formula -5,

Case splitting on down(address_of(ptyp!1)(ptr_val!1)) + i!1 + j!1 = down(address_of(ptyp!1)(ptr_val!1)) + (i!1 + j!1),

we get 2 subgoals:

`add_simplification.1.1:`

```
{-1}  down(address_of(ptyp')(ptr_val')) + i' + j' =
        down(address_of(ptyp')(ptr_val')) + (i' + j')
{-2}  not_null?(ptyp')(ptr_val')
{-3}  down(address_of(ptyp')(add(ptyp')(ptr_val', i' + j'))) =
        down(address_of(ptyp')(ptr_val')) + i' + j'
{-4}  not_null?(ptyp')(add(ptyp')(ptr_val', i'))
{-5}  down(address_of(ptyp')(add(ptyp')(add(ptyp')(ptr_val', i'), j'))) =
        down(address_of(ptyp')(ptr_val')) + i' + j'
{-6}  down(address_of(ptyp')(add(ptyp')(ptr_val', i'))) =
        down(address_of(ptyp')(ptr_val')) + i'
{-7}  not_null?(ptyp')(add(ptyp')(ptr_val', i' + j'))
{-8}  not_null?(ptyp')(add(ptyp')(add(ptyp')(ptr_val', i'), j'))
{-9}  Cpp_Type?(ptyp')
{-10} cv(pointer?)(ptyp')
{-11} range_pointer(cv_base(ptyp'))(ptr_val')
{-12} integer_pred(i')
{-13} integer_pred(j')
------------------------------------------------------------------
 {1}  address_of(ptyp')(add(ptyp')(add(ptyp')(ptr_val', i'), j')) =
        address_of(ptyp')(add(ptyp')(ptr_val', i' + j'))
```

Replacing using formula -1,
Replacing using formula -3,
Keeping (-5 -7 -8 1) and hiding *,
Using lemma address_of_spec,
Using lemma address_of_spec,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Hiding formulas: (-1 -3),
Rewriting using lift_up_extensionality, matching in *,
This completes the proof of `add_simplification.1.1`.
`add_simplification.1.2:`

```
{-1}  not_null?(ptyp')(ptr_val')
{-2}  down(address_of(ptyp')(add(ptyp')(ptr_val', i' + j'))) =
        down(address_of(ptyp')(ptr_val')) + i' + j'
{-3}  not_null?(ptyp')(add(ptyp')(ptr_val', i'))
{-4}  down(address_of(ptyp')(add(ptyp')(add(ptyp')(ptr_val', i'), j'))) =
        down(address_of(ptyp')(ptr_val')) + i' + j'
{-5}  down(address_of(ptyp')(add(ptyp')(ptr_val', i'))) =
        down(address_of(ptyp')(ptr_val')) + i'
{-6}  not_null?(ptyp')(add(ptyp')(ptr_val', i' + j'))
{-7}  not_null?(ptyp')(add(ptyp')(add(ptyp')(ptr_val', i'), j'))
{-8}  Cpp_Type?(ptyp')
{-9}  cv(pointer?)(ptyp')
{-10} range_pointer(cv_base(ptyp'))(ptr_val')
{-11} integer_pred(i')
{-12} integer_pred(j')
------------------------------------------------------------------
 {1}  down(address_of(ptyp')(ptr_val')) + i' + j' =
        down(address_of(ptyp')(ptr_val')) + (i' + j')
 {2}  address_of(ptyp')(add(ptyp')(add(ptyp')(ptr_val', i'), j')) =
        address_of(ptyp')(add(ptyp')(ptr_val', i' + j'))
```

Keeping (1) and hiding *,
Expanding the definition of +,

which is trivially true.
This completes the proof of `add_simplification.1.2`.
`add_simplification.2`:

{-1} Cpp_Type?(ptyp′)
{-2} cv(pointer?)(ptyp′)
{-3} range_pointer(cv_base(ptyp′))(ptr_val′)
{-4} integer_pred(i′)
{-5} integer_pred(j′)

{1} not_null?(ptyp′)(ptr_val′)
{2} address_of(ptyp′)(add(ptyp′)(add(ptyp′)(ptr_val′, i′), j′)) =
address_of(ptyp′)(add(ptyp′)(ptr_val′, i′ + j′))

Using lemma add_spec,
Using lemma add_spec,
Using lemma add_spec,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Expanding the definition of not_null?,
Using lemma address_of_spec2,
Using lemma address_of_spec2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `add_simplification.2`.
Q.E.D.

C.60.12 Cpp_pointer.void_pointer_other_pointer_value_TCC1

Terse proof for `void_pointer_other_pointer_value_TCC1`.
`void_pointer_other_pointer_value_TCC1`:

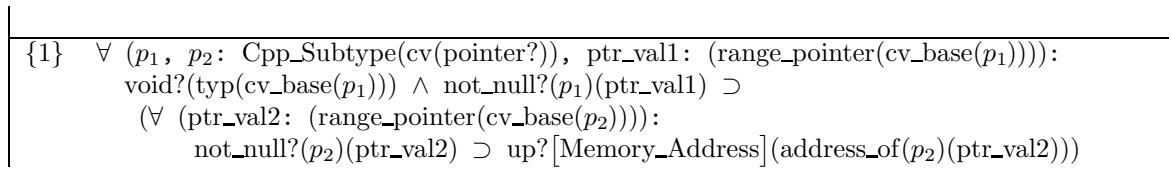
{1} ∀ (p1, p2: Cpp_Subtype(cv(pointer?)), ptr_val1: (range_pointer(cv_base(p1)))):
array?(cv_base(p1)) ∨
pointer?(cv_base(p1)) ∨
reference?(cv_base(p1)) ∨
bitfield?(cv_base(p1)) ∨
enum?(cv_base(p1)) ∨
pointer_to_member?(cv_base(p1)) ∨ const?(cv_base(p1)) ∨ volatile?(cv_base(p1))

Repeatedly Skolemizing and flattening,
Keeping (-2 2) and hiding *,
Rewriting using cv_base_result, matching in *,
Keeping (1) and hiding *,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `void_pointer_other_pointer_value_TCC1`.
Q.E.D.

C.60.13 Cpp_pointer.void_pointer_other_pointer_value_TCC2

Terse proof for `void_pointer_other_pointer_value_TCC2`.

`void_pointer_other_pointer_value_TCC2:`



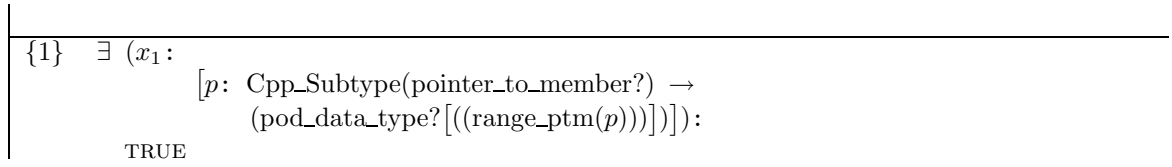
Repeatedly Skolemizing and flattening,
Rewriting using address_of_spec, matching in *,
This completes the proof of `void_pointer_other_pointer_value_TCC2`.
Q.E.D.

C.61 Proofs for Cpp_pointer_to_member (types.pvs)

C.61.1 Cpp_pointer_to_member.dt_ptm_TCC1

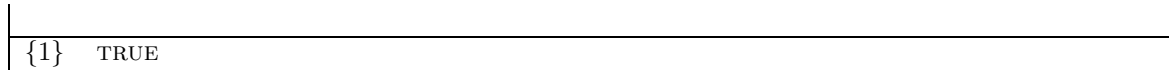
Terse proof for `dt_ptm_TCC1`.

`dt_ptm_TCC1:`



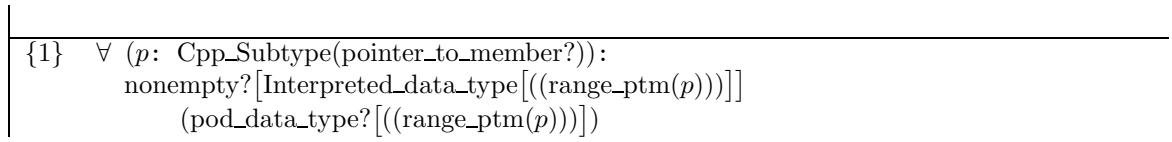
Instantiating the top quantifier in 1 with the terms: (λ (p: Cpp_Subtype(pointer_to_member?)): choose(pod_data_type?[((range_ptm(p)))])),
we get 2 subgoals:

`dt_ptm_TCC1.1:`



which is trivially true.
This completes the proof of `dt_ptm_TCC1.1`.

`dt_ptm_TCC1.2:`



Repeatedly Skolemizing and flattening,
Expanding the definition of nonempty?,
Expanding the definition of empty?,
Expanding the definition of member,
Using lemma dt_pointer_to_member_exists,
Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
This completes the proof of `dt_ptm_TCC1.2`.
Q.E.D.

C.62 Proofs for Cpp_reference (types.pvs)

C.62.1 Cpp_reference.dt_reference_TCC1

Terse proof for `dt_reference_TCC1`.

`dt_reference_TCC1:`

{1} ∃ (x_1: ⌊r: Cpp_Subtype(reference?) → (pod_data_type?⌊((alloc_range(r)))⌋)⌋): TRUE

Using lemma dt_ref_exists,

Instantiating the top quantifier in 1 with the terms: (LAMBDA (r: Cpp_Subtype(reference?)): choose(pod_data_type?[((alloc_range(r)))])),

we get 2 subgoals:

`dt_reference_TCC1.1:`

{-1} ∀ (r: Cpp_Subtype(reference?)): ∃ (dt: (pod_data_type?⌊((alloc_range(r)))⌋)): TRUE

{1} TRUE

which is trivially true.

This completes the proof of `dt_reference_TCC1.1`.

`dt_reference_TCC1.2:`

{-1} ∀ (r: Cpp_Subtype(reference?)): ∃ (dt: (pod_data_type?⌊((alloc_range(r)))⌋)): TRUE

{1} ∀ (r: Cpp_Subtype(reference?)): nonempty?⌊Interpreted_data_type⌊((alloc_range(r)))⌋⌋ (pod_data_type?⌊((alloc_range(r)))⌋)

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Expanding the definition of nonempty?,

Expanding the definition of empty?,

Repeatedly Skolemizing and flattening,

Instantiating quantified variables,

Expanding the definition of member,

which is trivially true.

This completes the proof of `dt_reference_TCC1.2`.

Q.E.D.

C.63 Proofs for Cpp_schar (types.pvs)

C.63.1 Cpp_schar.range_schar_TCC1

Terse proof for `range_schar_TCC1`.

`range_schar_TCC1:`

{1} ∃ (x: non_empty_finite_set⌊int⌋): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (n: int): $n = 0$),

we get 2 subgoals:

range_schar_TCC1.1:

{1} TRUE

which is trivially true.
This completes the proof of range_schar_TCC1.1.
range_schar_TCC1.2:

{1} is_finite[int](λ (n: int): n = 0) ∧ ¬ empty?[int](λ (n: int): n = 0)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: int): n = 0)): 0),
which is trivially true.
This completes the proof of range_schar_TCC1.2.
Q.E.D.

C.63.2 Cpp_schar.dt_schar_TCC1

Terse proof for dt_schar_TCC1.
dt_schar_TCC1:

{1} ∃ (x1: (pod_data_type?[(range_schar)])): TRUE

Rewriting using dt_schar_exists, matching in *,
This completes the proof of dt_schar_TCC1.
Q.E.D.

C.63.3 Cpp_schar.schar_value_eq_uchar_value_TCC1

Terse proof for schar_value_eq_uchar_value_TCC1.
schar_value_eq_uchar_value_TCC1:

{1} ∀ (i: (range_schar)): i ≥ 0 ⊃ (range_uchar)(i)

Repeatedly Skolemizing and flattening,
Rewriting using schar_nonneg_is_uchar, matching in *,
This completes the proof of schar_value_eq_uchar_value_TCC1.
Q.E.D.

C.63.4 Cpp_schar.value_bitmask_schar_TCC1

Terse proof for value_bitmask_schar_TCC1.
value_bitmask_schar_TCC1:

{1} ∃ (x1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_schar))}): TRUE

Using lemma list_all_length[Byte],
Instantiating the top quantifier in -1 with the terms: (size(uidt(dt_schar))),
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of value_bitmask_schar_TCC1.

Q.E.D.

C.64 Proofs for Cpp_short (types.pvs)

C.64.1 Cpp_short.range_short_TCC1

Terse proof for `range_short_TCC1`.

`range_short_TCC1:`

|
|---|
| {1} ∃ (x: non_empty_finite_set[int]): TRUE |

Instantiating the top quantifier in 1 with the terms: (λ (n: int): $n = 0$),
we get 2 subgoals:

`range_short_TCC1.1:`

|
|---|
| {1} TRUE |

which is trivially true.
This completes the proof of `range_short_TCC1.1`.

`range_short_TCC1.2:`

|
|---|
| {1} is_finite[int](λ (n: int): $n = 0$) $\wedge$ $\neg$ empty?[int](λ (n: int): $n = 0$) |

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: int): n = 0)): 0),
which is trivially true.
This completes the proof of `range_short_TCC1.2`.
Q.E.D.

C.64.2 Cpp_short.dt_short_TCC1

Terse proof for `dt_short_TCC1`.

`dt_short_TCC1:`

|
|---|
| {1} ∃ (x_1: (pod_data_type?[(range_short)])): TRUE |

Rewriting using dt_short_exists, matching in *,
This completes the proof of `dt_short_TCC1`.
Q.E.D.

C.64.3 Cpp_short.value_bitmask_short_TCC1

Terse proof for `value_bitmask_short_TCC1`.

`value_bitmask_short_TCC1:`

|
|---|
| {1} ∃ (x_1: {l: list[Byte] \| length[Byte](l) = size(uidt(dt_short))}): TRUE |

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of value_bitmask_short_TCC1.
Q.E.D.

C.65 Proofs for Cpp_uchar (types.pvs)

C.65.1 Cpp_uchar.range_uchar_TCC1

Terse proof for range_uchar_TCC1.
range_uchar_TCC1:

|
|---|
| {1} ∃ (x: non_empty_finite_set[nat]): TRUE |

Instantiating the top quantifier in 1 with the terms: (λ (n: nat): n = 0),
we get 2 subgoals:
range_uchar_TCC1.1:

|
|---|
| {1} TRUE |

which is trivially true.
This completes the proof of range_uchar_TCC1.1.
range_uchar_TCC1.2:

|
|---|
| {1} is_finite[nat](λ (n: nat): n = 0) ∧ ¬ empty?[nat](λ (n: nat): n = 0) |

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: nat): n = 0)): 0),
which is trivially true.
This completes the proof of range_uchar_TCC1.2.
Q.E.D.

C.65.2 Cpp_uchar.dt_uchar_TCC1

Terse proof for dt_uchar_TCC1.
dt_uchar_TCC1:

|
|---|
| {1} ∃ (x1: (pod_data_type?[(range_uchar)])): TRUE |

Using lemma dt_uchar_exists,
This completes the proof of dt_uchar_TCC1.
Q.E.D.

C.65.3 Cpp_uchar.value_bitmask_uchar_TCC1

Terse proof for value_bitmask_uchar_TCC1.
value_bitmask_uchar_TCC1:

|
|---|
| {1} ∃ (x1: {l: list[Byte] \| length[Byte](l) = size(uidt(dt_uchar))}): TRUE |

Using lemma list_all_length[Byte],

Instantiating the top quantifier in -1 with the terms: (size(uidt(dt_uchar))),
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_uchar_TCC1`.
Q.E.D.

C.66 Proofs for Cpp_uint (types.pvs)

C.66.1 Cpp_uint.range_uint_TCC1

Terse proof for `range_uint_TCC1`.
`range_uint_TCC1:`

{1} $\exists$ (x: non_empty_finite_set[nat]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (n: nat): $n = 0$),
we get 2 subgoals:
`range_uint_TCC1.1:`

{1} TRUE

which is trivially true.
This completes the proof of `range_uint_TCC1.1`.
`range_uint_TCC1.2:`

{1} is_finite[nat](λ (n: nat): $n = 0$) $\wedge$ $\neg$ empty?[nat](λ (n: nat): $n = 0$)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (p: (LAMBDA (n: nat): n = 0)): 0),
which is trivially true.
This completes the proof of `range_uint_TCC1.2`.
Q.E.D.

C.66.2 Cpp_uint.dt_uint_TCC1

Terse proof for `dt_uint_TCC1`.
`dt_uint_TCC1:`

{1} $\exists$ (x_1: (pod_data_type?[(range_uint)])): TRUE

Rewriting using dt_uint_exists, matching in *,
This completes the proof of `dt_uint_TCC1`.
Q.E.D.

C.66.3 Cpp_uint.uint_represenation_same_for_positive_int_TCC1

Terse proof for `uint_represenation_same_for_positive_int_TCC1`.
`uint_represenation_same_for_positive_int_TCC1:`

{1} $\forall$ (i: (range_int)): $i \geq 0 \supset$ (range_uint)(i)

Repeatedly Skolemizing and flattening,
Rewriting using uint_value_supset_int_value, matching in *,
This completes the proof of `uint_represenation_same_for_positive_int_TCC1`.
Q.E.D.

C.66.4 Cpp_uint.value_bitmask_uint_TCC1

Terse proof for `value_bitmask_uint_TCC1`.
`value_bitmask_uint_TCC1`:

$$\{1\}\quad \exists\ (x_1\colon \{l\colon \mathrm{list}[\mathrm{Byte}]\ \mid\ \mathrm{length}[\mathrm{Byte}](l) = \mathrm{size}(\mathrm{uidt}(\mathrm{dt\_uint}))\})\colon\ \textsc{true}$$

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_uint_TCC1`.
Q.E.D.

C.67 Proofs for Cpp_ulong (types.pvs)

C.67.1 Cpp_ulong.range_ulong_TCC1

Terse proof for `range_ulong_TCC1`.
`range_ulong_TCC1`:

$$\{1\}\quad \exists\ (x\colon \mathrm{non\_empty\_finite\_set}[\mathrm{nat}])\colon\ \textsc{true}$$

Instantiating the top quantifier in 1 with the terms: $(\lambda\ (n\colon \mathrm{nat})\colon n = 0)$,
we get 2 subgoals:
`range_ulong_TCC1.1`:

$$\{1\}\quad \textsc{true}$$

which is trivially true.
This completes the proof of `range_ulong_TCC1.1`.
`range_ulong_TCC1.2`:

$$\{1\}\quad \mathrm{is\_finite}[\mathrm{nat}](\lambda\ (n\colon \mathrm{nat})\colon n = 0) \wedge \neg\ \mathrm{empty?}[\mathrm{nat}](\lambda\ (n\colon \mathrm{nat})\colon n = 0)$$

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: nat): n = 0)): 0),
which is trivially true.
This completes the proof of `range_ulong_TCC1.2`.
Q.E.D.

C.67.2 Cpp_ulong.dt_ulong_TCC1

Terse proof for `dt_ulong_TCC1`.

dt_ulong_TCC1:

{1} ∃ (x_1: (pod_data_type?[(range_ulong)])): TRUE

Rewriting using dt_ulong_exists, matching in *,
This completes the proof of dt_ulong_TCC1.
Q.E.D.

C.67.3 Cpp_ulong.ulong_represenation_same_for_positive_long_TCC1

Terse proof for ulong_represenation_same_for_positive_long_TCC1.
ulong_represenation_same_for_positive_long_TCC1:

{1} ∀ (i: (range_long)): $i \geq 0 \supset$ (range_ulong)(i)

Repeatedly Skolemizing and flattening,
Rewriting using ulong_value_supset_long_value, matching in *,
This completes the proof of ulong_represenation_same_for_positive_long_TCC1.
Q.E.D.

C.67.4 Cpp_ulong.value_bitmask_ulong_TCC1

Terse proof for value_bitmask_ulong_TCC1.
value_bitmask_ulong_TCC1:

{1} ∃ (x_1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_ulong))}): TRUE

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of value_bitmask_ulong_TCC1.
Q.E.D.

C.68 Proofs for Cpp_ulonglong (types.pvs)

C.68.1 Cpp_ulonglong.range_ulonglong_TCC1

Terse proof for range_ulonglong_TCC1.
range_ulonglong_TCC1:

{1} ∃ (x: non_empty_finite_set[nat]): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (n: nat): $n = 0$),
we get 2 subgoals:
range_ulonglong_TCC1.1:

{1} TRUE

which is trivially true.
This completes the proof of range_ulonglong_TCC1.1.

range_ulonglong_TCC1.2:

{1} is_finite[nat](λ (n: nat): n = 0) ∧ ¬ empty?[nat](λ (n: nat): n = 0)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: nat): n = 0)): 0),
which is trivially true.
This completes the proof of range_ulonglong_TCC1.2.
Q.E.D.

C.68.2 Cpp_ulonglong.dt_ulonglong_TCC1

Terse proof for dt_ulonglong_TCC1.
dt_ulonglong_TCC1:

{1} ∃ (x1: (pod_data_type?[(range_ulonglong)])): TRUE

Rewriting using dt_ulonglong_exists, matching in *,
This completes the proof of dt_ulonglong_TCC1.
Q.E.D.

C.68.3 Cpp_ulonglong.ulonglong_represenation_same_for_positive_longlong_TCC1

Terse proof for ulonglong_represenation_same_for_positive_longlong_TCC1.
ulonglong_represenation_same_for_positive_longlong_TCC1:

{1} ∀ (i: (range_longlong)): i ≥ 0 ⊃ (range_ulonglong)(i)

Repeatedly Skolemizing and flattening,
Rewriting using ulonglong_value_supset_longlong_value, matching in *,
This completes the proof of ulonglong_represenation_same_for_positive_longlong_TCC1.
Q.E.D.

C.68.4 Cpp_ulonglong.value_bitmask_ulonglong_TCC1

Terse proof for value_bitmask_ulonglong_TCC1.
value_bitmask_ulonglong_TCC1:

{1} ∃ (x1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_ulonglong))}): TRUE

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of value_bitmask_ulonglong_TCC1.
Q.E.D.

C.69 Proofs for Cpp_union (types.pvs)

C.69.1 Cpp_union.uidt_union_TCC1

Terse proof for `uidt_union_TCC1`.

`uidt_union_TCC1:`

```
{1}  ∃ (x:
          [Cpp_Subtype(union?) → {uidt: (uninterpreted_data_type?) | size(uidt) > 0}]):
       TRUE
```

Instantiating the top quantifier in 1 with the terms: (λ (c: Cpp_Subtype(union?)): choose({uidt: (uninterpreted_data_type?) | size(uidt) > 0})),

we get 2 subgoals:

`uidt_union_TCC1.1:`

```
{1}  TRUE
```

which is trivially true.

This completes the proof of `uidt_union_TCC1.1`.

`uidt_union_TCC1.2:`

```
{1}  ∀ (c: Cpp_Subtype(union?)):
       nonempty?[(uninterpreted_data_type?)]
            ({uidt: (uninterpreted_data_type?) | size(uidt) > 0})
```

Trying repeated skolemization, instantiation, and if-lifting,

Instantiating the top quantifier in -3 with the terms: ((# size := 1, valid? := LAMBDA (l: list[Byte], a: Address): FALSE #)),

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `uidt_union_TCC1.2`.

Q.E.D.

C.70 Proofs for Cpp_ushort (types.pvs)

C.70.1 Cpp_ushort.range_ushort_TCC1

Terse proof for `range_ushort_TCC1`.

`range_ushort_TCC1:`

```
{1}  ∃ (x: non_empty_finite_set[nat]): TRUE
```

Instantiating the top quantifier in 1 with the terms: (λ (n: nat): n = 0),

we get 2 subgoals:

`range_ushort_TCC1.1:`

```
{1}  TRUE
```

which is trivially true.

This completes the proof of `range_ushort_TCC1.1`.

range_ushort_TCC1.2:

{1} is_finite[nat](λ (n: nat): n = 0) ∧ ¬ empty?[nat](λ (n: nat): n = 0)

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: nat): n = 0)): 0),
which is trivially true.
This completes the proof of range_ushort_TCC1.2.
Q.E.D.

C.70.2 Cpp_ushort.dt_ushort_TCC1

Terse proof for dt_ushort_TCC1.
dt_ushort_TCC1:

{1} ∃ (x1: (pod_data_type?[(range_ushort)])): TRUE

Rewriting using dt_ushort_exists, matching in *,
This completes the proof of dt_ushort_TCC1.
Q.E.D.

C.70.3 Cpp_ushort.ushort_represenation_same_for_positive_short_TCC1

Terse proof for ushort_represenation_same_for_positive_short_TCC1.
ushort_represenation_same_for_positive_short_TCC1:

{1} ∀ (i: (range_short)): i ≥ 0 ⊃ (range_ushort)(i)

Repeatedly Skolemizing and flattening,
Rewriting using ushort_value_supset_short_value, matching in *,
This completes the proof of ushort_represenation_same_for_positive_short_TCC1.
Q.E.D.

C.70.4 Cpp_ushort.value_bitmask_ushort_TCC1

Terse proof for value_bitmask_ushort_TCC1.
value_bitmask_ushort_TCC1:

{1} ∃ (x1: {l: list[Byte] | length[Byte](l) = size(uidt(dt_ushort))}): TRUE

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of value_bitmask_ushort_TCC1.
Q.E.D.

C.71 Proofs for Cpp_wchar_t (types.pvs)

C.71.1 Cpp_wchar_t.range_wchar_t_TCC1

Terse proof for `range_wchar_t_TCC1`.

`range_wchar_t_TCC1:`

$$\{1\} \quad \exists\ (x\colon \text{non\_empty\_finite\_set}[\text{int}])\colon \text{TRUE}$$

Instantiating the top quantifier in 1 with the terms: $(\lambda\ (n\colon \text{int})\colon n = 0)$,
we get 2 subgoals:

`range_wchar_t_TCC1.1:`

$$\{1\} \quad \text{TRUE}$$

which is trivially true.
This completes the proof of `range_wchar_t_TCC1.1`.

`range_wchar_t_TCC1.2:`

$$\{1\} \quad \text{is\_finite}[\text{int}](\lambda\ (n\colon \text{int})\colon n = 0) \wedge \neg\ \text{empty?}[\text{int}](\lambda\ (n\colon \text{int})\colon n = 0)$$

Trying repeated skolemization, instantiation, and if-lifting,
Instantiating the top quantifier in 1 with the terms: (1 LAMBDA (P: (LAMBDA (n: int): n = 0)): 0),
which is trivially true.
This completes the proof of `range_wchar_t_TCC1.2`.
Q.E.D.

C.71.2 Cpp_wchar_t.dt_wchar_t_TCC1

Terse proof for `dt_wchar_t_TCC1`.

`dt_wchar_t_TCC1:`

$$\{1\} \quad \exists\ (x_1\colon (\text{pod\_data\_type?}[(\text{range\_wchar\_t})]))\colon \text{TRUE}$$

Rewriting using dt_wchar_t_exists, matching in *,
This completes the proof of `dt_wchar_t_TCC1`.
Q.E.D.

C.71.3 Cpp_wchar_t.value_bitmask_wchar_t_TCC1

Terse proof for `value_bitmask_wchar_t_TCC1`.

`value_bitmask_wchar_t_TCC1:`

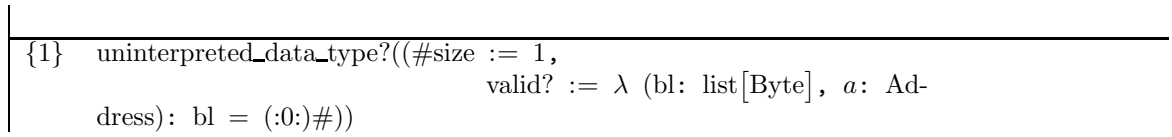
$$\{1\} \quad \exists\ (x_1\colon \{l\colon \text{list}[\text{Byte}]\ \mid\ \text{length}[\text{Byte}](l) = \text{size}(\text{uidt}(\text{dt\_wchar\_t}))\})\colon \text{TRUE}$$

Using lemma list_all_length[Byte],
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `value_bitmask_wchar_t_TCC1`.
Q.E.D.

C.72 Proofs for Datatype_Model (datatype_model.pvs)

C.72.1 Datatype_Model.uidt_1_TCC1

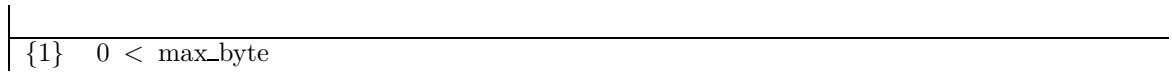
Terse proof for `uidt_1_TCC1`.
`uidt_1_TCC1`:



Trying repeated skolemization, instantiation, and if-lifting,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_1_TCC1`.
Q.E.D.

C.72.2 Datatype_Model.pod_1_TCC1

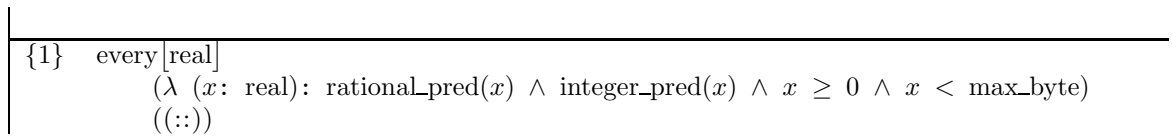
Terse proof for `pod_1_TCC1`.
`pod_1_TCC1`:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_1_TCC1`.
Q.E.D.

C.72.3 Datatype_Model.pod_1_TCC2

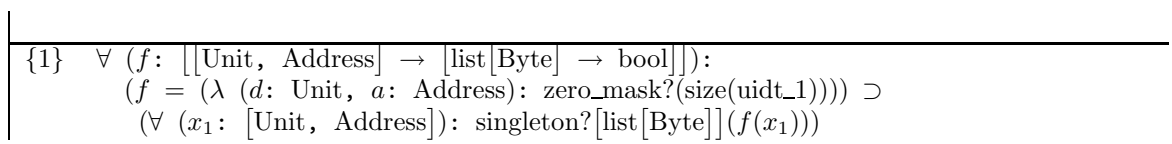
Terse proof for `pod_1_TCC2`.
`pod_1_TCC2`:



Trying repeated skolemization, instantiation, and if-lifting,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_1_TCC2`.
Q.E.D.

C.72.4 Datatype_Model.pod_1_TCC3

Terse proof for `pod_1_TCC3`.
`pod_1_TCC3`:



Repeatedly Skolemizing and flattening,
Replacing using formula -1,

Using lemma singleton_zero_mask,
Expanding the definition of singleton?,
which is trivially true.
This completes the proof of `pod_1_TCC3`.
Q.E.D.

C.72.5 Datatype_Model.pod_1_TCC4

Terse proof for `pod_1_TCC4`.
`pod_1_TCC4`:

```
{1}   pod_data_type?[Unit]
          ((#uidt := uidt_1,
                to_byte := λ (d: Unit, a: Address): (:0:),
                to_mask
                  := λ (f: [[Unit, Address] → [list[Byte] → bool]]):
                        λ (x1: [Unit, Address]): singleton_elt[list[Byte]](f(x1))
                          (λ (d: Unit, a: Address): zero_mask?(size(uidt_1))),
                from_byte
                  := λ (bl: list[Byte], a: Address):
                        IF bl = (:0:) THEN up[Unit](unit) ELSE bottom[Unit] ENDIF#))
```

Expanding the definition of pod_data_type?,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_1_TCC4`.
Q.E.D.

C.72.6 Datatype_Model.uidt_2_TCC1

Terse proof for `uidt_2_TCC1`.
`uidt_2_TCC1`:

```
{1}   uninterpreted_data_type?((#size := 1,
                                valid? := λ (bl: list[Byte], a: Ad-
      dress): bl = (:1:)#))
```

Trying repeated skolemization, instantiation, and if-lifting,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `uidt_2_TCC1`.
Q.E.D.

C.72.7 Datatype_Model.pod_2_TCC1

Terse proof for `pod_2_TCC1`.
`pod_2_TCC1`:

```
{1}   1 < max_byte
```

Trying repeated skolemization, instantiation, and if-lifting,
Applying less_than_max_byte
Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of pod_2_TCC1.
Q.E.D.

C.72.8 Datatype_Model.pod_2_TCC2

Terse proof for pod_2_TCC2.

pod_2_TCC2:

{1} ∀ (f: [[Unit, Address] → [list[Byte] → bool]]):
(f = (λ (d: Unit, a: Address): zero_mask?(size(uidt_2)))) ⊃
(∀ (x1: [Unit, Address]): singleton?[list[Byte]](f(x1)))

Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Using lemma singleton_zero_mask,
Expanding the definition of singleton?,
which is trivially true.
This completes the proof of pod_2_TCC2.
Q.E.D.

C.72.9 Datatype_Model.pod_2_TCC3

Terse proof for pod_2_TCC3.

pod_2_TCC3:

{1} pod_data_type?[Unit]
((#uidt := uidt_2,
to_byte := λ (d: Unit, a: Address): (:1:),
to_mask
:= λ (f: [[Unit, Address] → [list[Byte] → bool]]):
λ (x1: [Unit, Address]): singleton_elt[list[Byte]](f(x1))
(λ (d: Unit, a: Address): zero_mask?(size(uidt_2))),
from_byte
:= λ (bl: list[Byte], a: Address):
IF bl = (:1:) THEN up[Unit](unit) ELSE bottom[Unit] ENDIF#))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pod_2_TCC3.
Q.E.D.

C.73 Proofs for Datatype_Model_2 (datatype_model.pvs)

C.73.1 Datatype_Model_2.uidt_bool_TCC1

Terse proof for uidt_bool_TCC1.

`uidt_bool_TCC1:`

```
{1}  uninterpreted_data_type?((#size := 2,
                               valid?
                                 := λ (bl: list[Byte], a: Address):
                                      bl = (:0, 0:) ∨ bl = (:0, 1:)#))
```

Trying repeated skolemization, instantiation, and if-lifting,
we get 2 subgoals:
`uidt_bool_TCC1.1:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧
                   integer_pred(x) ∧ x ≥ 0 ∧ x < expt(2, bits_per_byte))
            ((:0, 0:))
{-2}  l′ = (:0, 0:)
-------------------------------------------------------------------------
 {1}  length((:0, 0:)) = 2
```

Expanding the definition of length,
Expanding the definition of length,
Expanding the definition of length,
which is trivially true.
This completes the proof of `uidt_bool_TCC1.1`.
`uidt_bool_TCC1.2:`

```
{-1}  every(λ (x: number):
                number_field_pred(x) ∧
                 real_pred(x) ∧
                  rational_pred(x) ∧
                   integer_pred(x) ∧ x ≥ 0 ∧ x < expt(2, bits_per_byte))
            ((:0, 1:))
{-2}  l′ = (:0, 1:)
-------------------------------------------------------------------------
 {1}  length((:0, 1:)) = 2
```

Expanding the definition of length,
Expanding the definition of length,
Expanding the definition of length,
which is trivially true.
This completes the proof of `uidt_bool_TCC1.2`.
Q.E.D.

C.73.2 Datatype_Model_2.pod_bool_TCC1

Terse proof for `pod_bool_TCC1`.
`pod_bool_TCC1:`

```
{1}  ∀ (d: bool): d ⊃ 0 < max_byte
```

Applying less_than_max_byte
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_bool_TCC1`.
Q.E.D.

C.73.3 Datatype_Model_2.pod_bool_TCC2

Terse proof for `pod_bool_TCC2`.

`pod_bool_TCC2:`

$$\{1\}\quad \forall\ (d\colon \text{bool})\colon\ d\ \supset\ \text{every}[\text{real}]\ (\lambda\ (x\colon \text{real})\colon \text{rational\_pred}(x)\ \wedge\ \text{integer\_pred}(x)\ \wedge\ x \geq 0\ \wedge\ x < \text{max\_byte})\ ((:1:))$$

Trying repeated skolemization, instantiation, and if-lifting,
Applying less_than_max_byte
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_bool_TCC2`.
Q.E.D.

C.73.4 Datatype_Model_2.pod_bool_TCC3

Terse proof for `pod_bool_TCC3`.

`pod_bool_TCC3:`

$$\{1\}\quad \forall\ (d\colon \text{bool})\colon\ \neg\ d\ \supset\ 0 < \text{max\_byte}$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_bool_TCC3`.
Q.E.D.

C.73.5 Datatype_Model_2.pod_bool_TCC4

Terse proof for `pod_bool_TCC4`.

`pod_bool_TCC4:`

$$\{1\}\quad \forall\ (d\colon \text{bool})\colon\ \neg\ d\ \supset\ \text{every}[\text{real}]\ (\lambda\ (x\colon \text{real})\colon \text{rational\_pred}(x)\ \wedge\ \text{integer\_pred}(x)\ \wedge\ x \geq 0\ \wedge\ x < \text{max\_byte})\ ((:0:))$$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_bool_TCC4`.
Q.E.D.

C.73.6 Datatype_Model_2.pod_bool_TCC5

Terse proof for `pod_bool_TCC5`.

`pod_bool_TCC5:`

$$\{1\}\quad \forall\ (f\colon [[\text{bool}, \text{Address}] \rightarrow [\text{list}[\text{Byte}] \rightarrow \text{bool}]])\colon\ (f = (\lambda\ (d\colon \text{bool}, a\colon \text{Address})\colon \text{zero\_mask?}(\text{size}(\text{uidt\_bool})))) \supset\ (\forall\ (x_1\colon [\text{bool}, \text{Address}])\colon \text{singleton?}[\text{list}[\text{Byte}]](f(x_1)))$$

Repeatedly Skolemizing and flattening,

Replacing using formula -1,

Using lemma singleton_zero_mask,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

This completes the proof of `pod_bool_TCC5`.

Q.E.D.

C.73.7 Datatype_Model_2.pod_bool_TCC6

Terse proof for `pod_bool_TCC6`.

`pod_bool_TCC6:`

```
{1}  pod_data_type?[bool]
       ((#uidt := uidt_bool,
           to_byte := λ (d: bool, a: Address): IF d THEN (:0, 1:) ELSE (:0, 0:) ENDIF,
           to_mask
             := λ (f: [[bool, Address] → [list[Byte] → bool]]):
                  λ (x1: [bool, Address]): singleton_elt[list[Byte]](f(x1))
                    (λ (d: bool, a: Address): zero_mask?(size(uidt_bool))),
           from_byte
             := λ (bl: list[Byte], a: Address):
                  IF bl = (:0, 1:)
                    THEN up[boolean](TRUE)
                  ELSE IF bl = (:0, 0:) THEN up[boolean](FALSE) ELSE bottom[boolean] ENDIF
                  ENDIF#))
```

Trying repeated skolemization, instantiation, and if-lifting,

Using lemma min_bits_per_byte,

Using lemma bits_per_byte_minimum,

Using lemma pos_expt_gt,

Case splitting on 1 < expt(2, bits_per_byte),

we get 2 subgoals:

`pod_bool_TCC6.1:`

```
{-1}  1 < expt(2, bits_per_byte)
{-2}  bits_per_byte < 2 ^ bits_per_byte
{-3}  bits_per_byte ≥ min_bits_per_byte
{-4}  min_bits_per_byte = 8
{-5}  (:0, 0:) = (:0, 1:)
-------------------------
 {1}  d'
```

Applying decompose-equality,

Applying decompose-equality,

This completes the proof of `pod_bool_TCC6.1`.

pod_bool_TCC6.2:

```
{-1}  bits_per_byte < 2 ^ bits_per_byte
{-2}  bits_per_byte ≥ min_bits_per_byte
{-3}  min_bits_per_byte = 8
{-4}  (:0, 0:) = (:0, 1:)
-------------------------------------------
{1}   1 < expt(2, bits_per_byte)
{2}   d′
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pod_bool_TCC6.2.
Q.E.D.

C.73.8 Datatype_Model_2.uidt_Byte_TCC1

Terse proof for uidt_Byte_TCC1.
uidt_Byte_TCC1:

```
-------------------------------------------
{1}   ∀ (bl: list[Byte]): length(bl) = 2 ⊃ cons?[Byte](bl)
```

Trying repeated skolemization, instantiation, and if-lifting,
Expanding the definition of length,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of uidt_Byte_TCC1.
Q.E.D.

C.73.9 Datatype_Model_2.uidt_Byte_TCC2

Terse proof for uidt_Byte_TCC2.
uidt_Byte_TCC2:

```
-------------------------------------------
{1}   uninterpreted_data_type?((#size := 2,
                                valid?
                                  := λ (bl: list[Byte], a: Address):
                                       length[Byte](bl) = 2 ∧ car[Byte](bl) = 1#))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of uidt_Byte_TCC2.
Q.E.D.

C.73.10 Datatype_Model_2.pod_Byte_TCC1

Terse proof for pod_Byte_TCC1.
pod_Byte_TCC1:

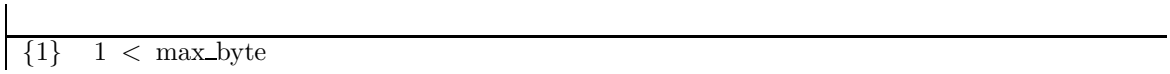
```
-------------------------------------------
{1}   ∀ (bl: list[Byte]): length(bl) = 2 ∧ car(bl) = 1 ⊃ cons?[Byte](cdr[Byte](bl))
```

Trying repeated skolemization, instantiation, and if-lifting,
Expanding the definition of length,
Expanding the definition of length,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of pod_Byte_TCC1.

Q.E.D.

C.73.11 Datatype_Model_2.pod_Byte_TCC2

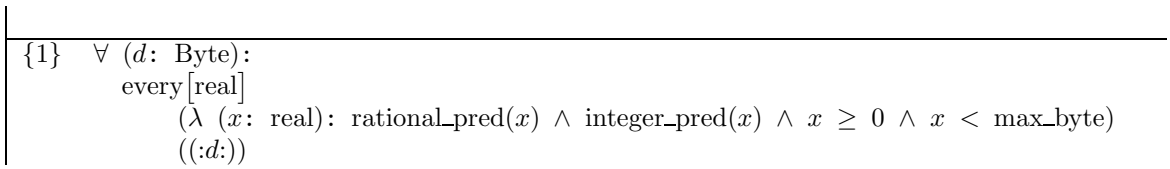
Terse proof for `pod_Byte_TCC2`.
`pod_Byte_TCC2:`



Trying repeated skolemization, instantiation, and if-lifting,
Applying less_than_max_byte
Expanding the definition of max_byte,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_Byte_TCC2`.
Q.E.D.

C.73.12 Datatype_Model_2.pod_Byte_TCC3

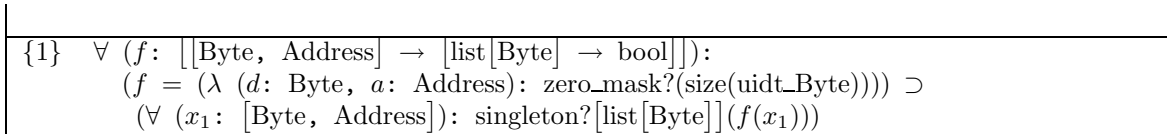
Terse proof for `pod_Byte_TCC3`.
`pod_Byte_TCC3:`



Repeatedly Skolemizing and flattening,
Expanding the definition of every,
Expanding the definition of every,
which is trivially true.
This completes the proof of `pod_Byte_TCC3`.
Q.E.D.

C.73.13 Datatype_Model_2.pod_Byte_TCC4

Terse proof for `pod_Byte_TCC4`.
`pod_Byte_TCC4:`



Repeatedly Skolemizing and flattening,
Replacing using formula -1,
Using lemma singleton_zero_mask,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `pod_Byte_TCC4`.
Q.E.D.

C.73.14 Datatype_Model_2.pod_Byte_TCC5

Terse proof for `pod_Byte_TCC5`.

`pod_Byte_TCC5`:

```
{1}  pod_data_type?[Byte]
       ((#uidt := uidt_Byte,
         to_byte := λ (d: Byte, a: Address): (:1, d:),
         to_mask
           := λ (f: [[Byte, Address] → [list[Byte] → bool]]):
                λ (x1: [Byte, Address]): singleton_elt[list[Byte]](f(x1))
                  (λ (d: Byte, a: Address): zero_mask?(size(uidt_Byte))),
         from_byte
           := λ (bl: list[Byte], a: Address):
                IF length[Byte](bl) = 2 ∧ car[Byte](bl) = 1
                  THEN up[Byte](car[Byte](cdr[Byte](bl)))
                ELSE bottom[Byte]
                ENDIF#))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `pod_Byte_TCC5`.
Q.E.D.

C.74 Proofs for DeclarationStatements1 (statements.pvs)

This theory contains no provable formal statements.

C.75 Proofs for DeclarationStatements2 (statements.pvs)

This theory contains no provable formal statements.

C.76 Proofs for Device_Memory (device_memory.pvs)

This theory contains no provable formal statements.

C.77 Proofs for EqualityExpressions (expressions.pvs)

This theory contains no provable formal statements.

C.78 Proofs for Error_Code_Types (result.pvs)

This theory contains no provable formal statements.

C.79 Proofs for Even_More_List_Props (vfiasco-prelude.pvs)

C.79.1 Even_More_List_Props.every_extend

Terse proof for `every_extend`.

`every_extend:`

$$\{1\}\quad \forall\ (l\colon \text{list}[S],\ P\colon \text{PRED}[T])\colon \text{every}(\lambda\ (t\colon T)\colon P(t))(l) \supset \text{every}(\lambda\ (s\colon S)\colon P(s))(l)$$

Inducting on l on formula 1,

we get 2 subgoals:

`every_extend.1:`

$$\{1\}\quad \forall\ (P\colon \text{PRED}[T])\colon \text{every}(\lambda\ (t\colon T)\colon P(t))(\text{null}) \supset \text{every}(\lambda\ (s\colon S)\colon P(s))(\text{null})$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `every_extend.1`.

`every_extend.2:`

$$\begin{array}{l}\{1\}\quad \forall\ (\text{cons1\_var}\colon S,\ \text{cons2\_var}\colon \text{list}[S])\colon\\ \quad (\forall\ (P\colon \text{PRED}[T])\colon\\ \quad\quad \text{every}(\lambda\ (t\colon T)\colon P(t))(\text{cons2\_var}) \supset\\ \quad\quad\ \text{every}(\lambda\ (s\colon S)\colon P(s))(\text{cons2\_var}))\\ \quad\ \supset\\ \quad (\forall\ (P\colon \text{PRED}[T])\colon\\ \quad\quad \text{every}(\lambda\ (t\colon T)\colon P(t))(\text{cons}(\text{cons1\_var},\ \text{cons2\_var})) \supset\\ \quad\quad\ \text{every}(\lambda\ (s\colon S)\colon P(s))(\text{cons}(\text{cons1\_var},\ \text{cons2\_var})))\end{array}$$

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `every_extend.2`.

Q.E.D.

C.80 Proofs for Exception_type (result.pvs)

This theory contains no provable formal statements.

C.81 Proofs for Exception_type_adt (Exception_type_adt.pvs)

This theory contains no provable formal statements.

C.82 Proofs for Exception_type_adt_reduce (Exception_type_adt.pvs)

This theory contains no provable formal statements.

C.83 Proofs for Expand_State (device_memory.pvs)

C.83.1 Expand_State.em_transformers_ok

Terse proof for `em_transformers_ok`.

`em_transformers_ok`:

```
{1}  ∀ (states: PRED[State], transformers: PRED[[State → SuperResult[State]]]):
       transformers_ok?(states, transformers) ⊃
         transformers_ok?(em_lift(states), em_lift(transformers))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_transformers_ok`.
Q.E.D.

C.83.2 Expand_State.em_transformer_invariant

Terse proof for `em_transformer_invariant`.

`em_transformer_invariant`:

```
{1}  ∀ (states: PRED[State], transformers: PRED[[State → SuperResult[State]]]):
       transformer_invariant?(states, transformers) ⊃
         transformer_invariant?(em_lift(states), em_lift(transformers))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_transformer_invariant`.
Q.E.D.

C.83.3 Expand_State.em_lift_singleton

Terse proof for `em_lift_singleton`.

`em_lift_singleton`:

```
{1}  ∀ (q: [State → SuperResult[State]]):
       singleton(em_lift(q)) = em_lift(singleton(q))
```

Repeatedly Skolemizing and flattening,
Applying decompose-equality,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_lift_singleton`.
Q.E.D.

C.84 Proofs for Expand_State2 (device_memory.pvs)

C.84.1 Expand_State2.em_lift_expr_2_super

Terse proof for `em_lift_expr_2_super`.

`em_lift_expr_2_super`:

```
{1}  ∀ (stf: [State → ExprResult[State, Data]]):
       expr_2_super(em_lift(stf)) = em_lift(expr_2_super(stf))
```

Repeatedly Skolemizing and flattening,
Applying decompose-equality,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_lift_expr_2_super`.
Q.E.D.

C.85 Proofs for Expand_State3 (device_memory.pvs)

C.85.1 Expand_State3.em_memory_read_transformers

Terse proof for `em_memory_read_transformers`.

`em_memory_read_transformers`:

```
{1}  ∀ (addresses: PRED[Address], em_pm: Memory_struct[Expand_state[State, T]],
          pm: Memory_struct[State]):
       (em_pm`memory_read =
          (λ (a: Address): em_lift[State, T, Byte](pm`memory_read(a))))
        ⊃
        memory_read_transformers(em_pm, addresses) =
         em_lift(memory_read_transformers(pm, addresses))
```

Repeatedly Skolemizing and flattening,
Applying decompose-equality,
Expanding the definition of memory_read_transformers,
Replacing using formula -1,
Hiding formulas: -1,
Expanding the definition of em_lift,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

`em_memory_read_transformers.1`:

```
{-1}  ∃ (a: Address):
        addresses′(a) ∧ x′ = expr_2_super(em_lift[State, T, Byte](pm′`memory_read(a)))
{1}  ∃ (p:
          (λ (q: [State → SuperResult[State]]):
             ∃ (a: Address):
               addresses′(a) ∧ q = expr_2_super(memory_read(pm′)(a)))):
       x′ = em_lift(p)
```

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (expr_2_super(pm!1`memory_read(a!1))),
we get 2 subgoals:

em_memory_read_transformers.1.1:

```
{-1}  addresses'(a')
{-2}  x' = expr_2_super(em_lift[State, T, Byte](pm'`memory_read(a')))
------------------------------------------------------------------------
{1}   x' = em_lift(expr_2_super(pm'`memory_read(a')))
```

Rewriting using em_lift_expr_2_super[State, T, Byte], matching in *,
This completes the proof of em_memory_read_transformers.1.1.
em_memory_read_transformers.1.2:

```
{-1}  addresses'(a')
{-2}  x' = expr_2_super(em_lift[State, T, Byte](pm'`memory_read(a')))
------------------------------------------------------------------------
{1}   ∃ (a: Address):
        addresses'(a) ∧
         expr_2_super[State, Byte](pm'`memory_read(a')) =
           expr_2_super[State, Byte](memory_read(pm')(a))
```

Instantiating quantified variables,
This completes the proof of em_memory_read_transformers.1.2.
em_memory_read_transformers.2:

```
{-1}  ∃ (p:
            (λ (q: [State → SuperResult[State]]):
                 ∃ (a: Address):
                   addresses'(a) ∧ q = expr_2_super(memory_read(pm')(a)))):
        x' = em_lift(p)
------------------------------------------------------------------------
{1}   ∃ (a: Address):
        addresses'(a) ∧ x' = expr_2_super(em_lift[State, T, Byte](pm'`memory_read(a)))
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Rewriting using em_lift_expr_2_super[State, T, Byte], matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of em_memory_read_transformers.2.
Q.E.D.

C.85.2 Expand_State3.em_memory_write_transformers

Terse proof for em_memory_write_transformers.
em_memory_write_transformers:

```
------------------------------------------------------------------------
{1}   ∀ (addresses: PRED[Address], em_pm: Memory_struct[Expand_state[State, T]],
           pm: Memory_struct[State]):
        (em_pm`memory_write =
           (λ (a: Address, b: Byte): em_lift[State, T, Unit](pm`memory_write(a, b))))
         ⊃
         memory_write_transformers(em_pm, addresses) =
          em_lift(memory_write_transformers(pm, addresses))
```

Repeatedly Skolemizing and flattening,
Applying decompose-equality,
Expanding the definition of memory_write_transformers,
Replacing using formula -1,
Hiding formulas: -1,
Expanding the definition of em_lift,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`em_memory_write_transformers.1:`

```
{-1}  ∃ (a: Address, b: Byte):
        addresses′(a) ∧
          x′ = expr_2_super(em_lift[State, T, Unit](pm′‘memory_write(a, b)))
{1}   ∃ (p:
           (λ (q: [State → SuperResult[State]]):
                ∃ (a: Address, b: Byte):
                  addresses′(a) ∧ q = expr_2_super(memory_write(pm′)(a, b)))):
        x′ = em_lift(p)
```

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in 1 with the terms: (expr_2_super(pm!1‘memory_write(a!1, b!1))),
we get 2 subgoals:
`em_memory_write_transformers.1.1:`

```
{-1}  b′ < max_byte
{-2}  addresses′(a′)
{-3}  x′ = expr_2_super(em_lift[State, T, Unit](pm′‘memory_write(a′, b′)))
{1}   x′ = em_lift(expr_2_super(pm′‘memory_write(a′, b′)))
```

Rewriting using em_lift_expr_2_super, matching in *,
This completes the proof of `em_memory_write_transformers.1.1`.
`em_memory_write_transformers.1.2:`

```
{-1}  b′ < max_byte
{-2}  addresses′(a′)
{-3}  x′ = expr_2_super(em_lift[State, T, Unit](pm′‘memory_write(a′, b′)))
{1}   ∃ (a: Address, b: Byte):
        addresses′(a) ∧
          expr_2_super[State, Unit](pm′‘memory_write(a′, b′)) =
            expr_2_super[State, Unit](memory_write(pm′)(a, b))
```

Instantiating quantified variables,
This completes the proof of `em_memory_write_transformers.1.2`.
`em_memory_write_transformers.2:`

```
{-1}  ∃ (p:
           (λ (q: [State → SuperResult[State]]):
                ∃ (a: Address, b: Byte):
                  addresses′(a) ∧ q = expr_2_super(memory_write(pm′)(a, b)))):
        x′ = em_lift(p)
{1}   ∃ (a: Address, b: Byte):
        addresses′(a) ∧
          x′ = expr_2_super(em_lift[State, T, Unit](pm′‘memory_write(a, b)))
```

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Rewriting using em_lift_expr_2_super, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `em_memory_write_transformers.2`.
Q.E.D.

C.85.3 Expand_State3.em_unchanged_memory_invariant

Terse proof for `em_unchanged_memory_invariant`.

`em_unchanged_memory_invariant`:

{1} ∀ (addresses: PRED[Address], em_pm: Memory_struct[Expand_state[State, T]],
pm: Memory_struct[State], states: PRED[State],
transformers: PRED[[State → SuperResult[State]]]):
(em_pm‘memory_read =
(λ (a: Address): em_lift[State, T, Byte](pm‘memory_read(a))))
∧ unchanged_memory_invariant?(pm, states, transformers, addresses)
⊃ unchanged_memory_invariant?(em_pm, em_lift(states), em_lift(transformers), addresses)

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `em_unchanged_memory_invariant`.

Q.E.D.

C.85.4 Expand_State3.em_changed_memory_invariant

Terse proof for `em_changed_memory_invariant`.

`em_changed_memory_invariant`:

{1} ∀ (addresses: PRED[Address], em_pm: Memory_struct[Expand_state[State, T]],
pm: Memory_struct[State], states: PRED[State]):
(em_pm‘memory_read =
(λ (a: Address): em_lift[State, T, Byte](pm‘memory_read(a))))
∧
(em_pm‘memory_write =
(λ (a: Address, b: Byte): em_lift[State, T, Unit](pm‘memory_write(a, b))))
∧ changed_memory_invariant?(pm, states, addresses)
⊃ changed_memory_invariant?(em_pm, em_lift(states), addresses)

Expanding the definition of changed_memory_invariant?,

Repeatedly Skolemizing and flattening,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 3 subgoals:

`em_changed_memory_invariant.1:`

```
{-1}  (em_pm'`memory_read =
         (λ (a: Address): em_lift[State, T, Byte](pm'`memory_read(a))))
{-2}  (em_pm'`memory_write =
         (λ (a: Address, b: Byte): em_lift[State, T, Unit](pm'`memory_write(a, b))))
{-3}  transformer_invariant?(states', memory_read_transformers(pm', addresses'))
{-4}  transformer_invariant?(states', memory_write_transformers(pm', addresses'))
{-5}  ∀ (s: State, a: Address, b: Byte):
        states'(s) ∧
         addresses'(a) ∧
          OK?(memory_write(pm')(a, b)(s)) ∧
           OK?(memory_read(pm')(a)(state(memory_write(pm')(a, b)(s))))
        ⊃ data(memory_read(pm')(a)(state(memory_write(pm')(a, b)(s)))) = b
-------------------------------------------------------------------------
{1}   ∀ (s: Expand_state[State, T], a: Address, b: Byte):
        em_lift(states')(s) ∧
         addresses'(a) ∧
          OK?(memory_write(em_pm')(a, b)(s)) ∧
           OK?(memory_read(em_pm')(a)(state(memory_write(em_pm')(a, b)(s))))
         ⊃ data(memory_read(em_pm')(a)(state(memory_write(em_pm')(a, b)(s)))) = b
```

Trying repeated skolemization, instantiation, and if-lifting,

This completes the proof of `em_changed_memory_invariant.1`.

`em_changed_memory_invariant.2:`

```
{-1}  (em_pm'`memory_read =
         (λ (a: Address): em_lift[State, T, Byte](pm'`memory_read(a))))
{-2}  (em_pm'`memory_write =
         (λ (a: Address, b: Byte): em_lift[State, T, Unit](pm'`memory_write(a, b))))
{-3}  transformer_invariant?(states', memory_read_transformers(pm', addresses'))
{-4}  transformer_invariant?(states', memory_write_transformers(pm', addresses'))
{-5}  ∀ (s: State, a: Address, b: Byte):
        states'(s) ∧
         addresses'(a) ∧
          OK?(memory_write(pm')(a, b)(s)) ∧
           OK?(memory_read(pm')(a)(state(memory_write(pm')(a, b)(s))))
        ⊃ data(memory_read(pm')(a)(state(memory_write(pm')(a, b)(s)))) = b
-------------------------------------------------------------------------
{1}   transformer_invariant?(em_lift(states'), memory_write_transformers(em_pm', addresses'))
```

Keeping (-2 -4 1) and hiding *,

Using lemma em_memory_write_transformers,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Replacing using formula -2,

Rewriting using em_transformer_invariant, matching in *,

This completes the proof of `em_changed_memory_invariant.2`.

`em_changed_memory_invariant.3`:

{-1} (em_pm′‘memory_read =
(λ (a: Address): em_lift[State, T, Byte](pm′‘memory_read(a))))
{-2} (em_pm′‘memory_write =
(λ (a: Address, b: Byte): em_lift[State, T, Unit](pm′‘memory_write(a, b))))
{-3} transformer_invariant?(states′, memory_read_transformers(pm′, addresses′))
{-4} transformer_invariant?(states′, memory_write_transformers(pm′, addresses′))
{-5} ∀ (s: State, a: Address, b: Byte):
states′(s) ∧
addresses′(a) ∧
OK?(memory_write(pm′)(a, b)(s)) ∧
OK?(memory_read(pm′)(a)(state(memory_write(pm′)(a, b)(s))))
⊃ data(memory_read(pm′)(a)(state(memory_write(pm′)(a, b)(s)))) = b
---
{1} transformer_invariant?(em_lift(states′), memory_read_transformers(em_pm′, addresses′))

Keeping (-1 -3 1) and hiding *,
Using lemma em_memory_read_transformers,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
Replacing using formula -2,
Rewriting using em_transformer_invariant, matching in *,
This completes the proof of `em_changed_memory_invariant.3`.
Q.E.D.

C.85.5 Expand_State3.em_const_unchanged_memory_invariant_TCC1

Terse proof for `em_const_unchanged_memory_invariant_TCC1`.

`em_const_unchanged_memory_invariant_TCC1`:

{1} ∀ (em_pm: Memory_struct[Expand_state[State, T]], pm: Memory_struct[State],
q: [Expand_state[State, T] → SuperResult[Expand_state[State, T]]]):
(em_pm‘memory_read =
(λ (a: Address): em_lift[State, T, Byte](pm‘memory_read(a))))
⊃
(∀ (s: Expand_state[State, T]):
has_next_state(q(s)) ⊃
OK?[Expand_state[State, T]](q(s)) ∨
abnormal?[Expand_state[State, T]](q(s)))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_const_unchanged_memory_invariant_TCC1`.
Q.E.D.

C.85.6 Expand_State3.em_const_unchanged_memory_invariant

Terse proof for `em_const_unchanged_memory_invariant`.

`em_const_unchanged_memory_invariant:`

```
{1}  ∀ (addresses: PRED[Address], em_pm: Memory_struct[Expand_state[State, T]],
          pm: Memory_struct[State], states: PRED[State],
          q: [Expand_state[State, T] → SuperResult[Expand_state[State, T]]]):
       (em_pm`memory_read =
          (λ (a: Address): em_lift[State, T, Byte](pm`memory_read(a))))
        ∧
        (∀ (s: Expand_state[State, T]):
            has_next_state(q(s)) ⊃ state(q(s))`state = s`state)
        ⊃ unchanged_memory_invariant?(em_pm, em_lift(states), singleton(q), addresses)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_const_unchanged_memory_invariant`.
Q.E.D.

C.85.7 Expand_State3.em_side_effect_content_unchanged

Terse proof for `em_side_effect_content_unchanged`.

`em_side_effect_content_unchanged:`

```
{1}  ∀ (addresses: PRED[Address],
          se_transformer:
            [[Address, list[Byte], bool] → [State → ExprResult[State, list[Byte]]]],
          states: PRED[State]):
       side_effect_content_unchanged(addresses, states, se_transformer) ⊃
        side_effect_content_unchanged(addresses, em_lift(states),
                                      λ (a: Address, bl: list[Byte], cp: bool):
                                        em_lift[State, T, list[Byte]]
                                          (se_transformer(a, bl, cp)))
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `em_side_effect_content_unchanged`.
Q.E.D.

C.86 Proofs for ExprResult (result.pvs)

This theory contains no provable formal statements.

C.87 Proofs for ExprResult_adt (ExprResult_adt.pvs)

This theory contains no provable formal statements.

C.88 Proofs for ExprResult_adt_map (ExprResult_adt.pvs)

This theory contains no provable formal statements.

C.89 Proofs for ExprResult_adt_reduce (ExprResult_adt.pvs)

This theory contains no provable formal statements.

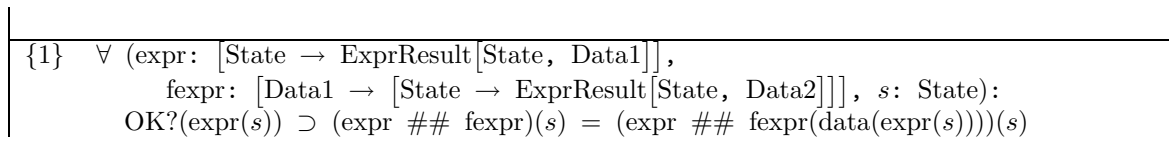
C.90 Proofs for ExpressionStatements (statements.pvs)

This theory contains no provable formal statements.

C.91 Proofs for Expression_Composition_Rewrites (state-transformer.pvs)

C.91.1 Expression_Composition_Rewrites.comp_eval_if_ok_fexpr

Terse proof for `comp_eval_if_ok_fexpr`.
`comp_eval_if_ok_fexpr:`



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `comp_eval_if_ok_fexpr`.
Q.E.D.

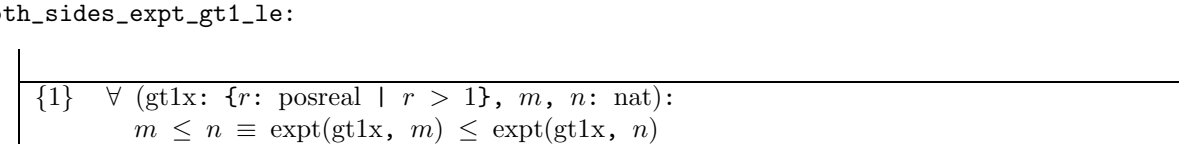
C.92 Proofs for Expressions (expressions.pvs)

This theory contains no provable formal statements.

C.93 Proofs for Expt_Lemmas (vfiasco-prelude.pvs)

C.93.1 Expt_Lemmas.both_sides_expt_gt1_le

Terse proof for `both_sides_expt_gt1_le`.
`both_sides_expt_gt1_le:`



Repeatedly Skolemizing and flattening,
Using lemma both_sides_expt_gt1_le_aux,
Expanding the definition of expt,
Using lemma both_sides_times_pos_le2,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `both_sides_expt_gt1_le`.
Q.E.D.

C.93.2 Expt_Lemmas.expt_plus

Terse proof for `expt_plus`.
`expt_plus`:

{1} ∀ (n0x: nzreal, m, n: nat):
expt(n0x, m) × expt(n0x, n) = expt(n0x, $m+n$)

Repeatedly Skolemizing and flattening,
Using lemma expt_plus_aux,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `expt_plus`.
Q.E.D.

C.94 Proofs for Extended_Real (vfiasco-prelude.pvs)

C.94.1 Extended_Real.number_field_extended

Terse proof for `number_field_extended`.
`number_field_extended`:

{1} ∀ (x: number_field): extended_real?(x)

Repeatedly Skolemizing and flattening,
Rewriting using extended_real_superset_of_number_fields, matching in *,
This completes the proof of `number_field_extended`.
Q.E.D.

C.94.2 Extended_Real.er_plus_TCC1

Terse proof for `er_plus_TCC1`.
`er_plus_TCC1`:

{1} ∃ (x_1: ⌊⌊extended_real, extended_real⌋ → extended_real⌋): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (x, y: extended_real): x),
which is trivially true.
This completes the proof of `er_plus_TCC1`.
Q.E.D.

C.94.3 Extended_Real.er_neg_TCC1

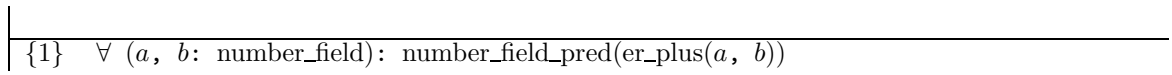
Terse proof for `er_neg_TCC1`.
`er_neg_TCC1`:

{1} ∃ (x_1: ⌊extended_real → extended_real⌋): TRUE

Instantiating the top quantifier in 1 with the terms: (λ (x: extended_real): x),
which is trivially true.
This completes the proof of `er_neg_TCC1`.
Q.E.D.

C.94.4 Extended_Real.er_plus_number_field

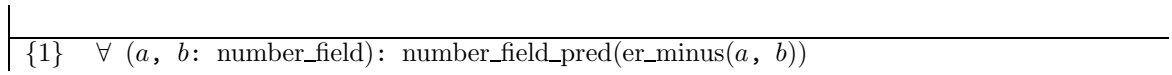
Terse proof for `er_plus_number_field`.
`er_plus_number_field`:



Repeatedly Skolemizing and flattening,
Rewriting using er_plus_ax, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `er_plus_number_field`.
Q.E.D.

C.94.5 Extended_Real.er_minus_number_field

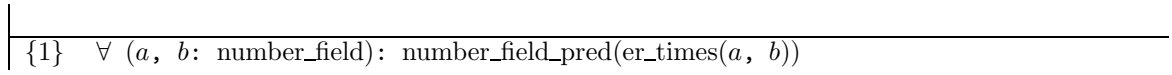
Terse proof for `er_minus_number_field`.
`er_minus_number_field`:



Repeatedly Skolemizing and flattening,
Rewriting using er_minus_ax, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `er_minus_number_field`.
Q.E.D.

C.94.6 Extended_Real.er_times_number_field

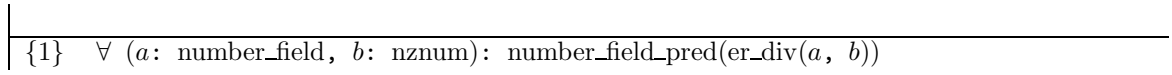
Terse proof for `er_times_number_field`.
`er_times_number_field`:



Repeatedly Skolemizing and flattening,
Rewriting using er_times_ax, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `er_times_number_field`.
Q.E.D.

C.94.7 Extended_Real.er_div_number_field

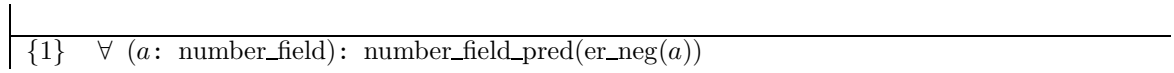
Terse proof for `er_div_number_field`.
`er_div_number_field`:



Repeatedly Skolemizing and flattening,
Rewriting using er_div_ax, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `er_div_number_field`.
Q.E.D.

C.94.8 Extended_Real.er_neg_number_field

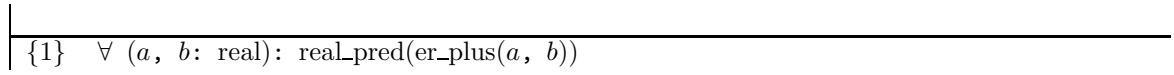
Terse proof for `er_neg_number_field`.
`er_neg_number_field:`



Repeatedly Skolemizing and flattening,
Rewriting using er_neg_ax, matching in *,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `er_neg_number_field`.
Q.E.D.

C.94.9 Extended_Real.er_plus_real

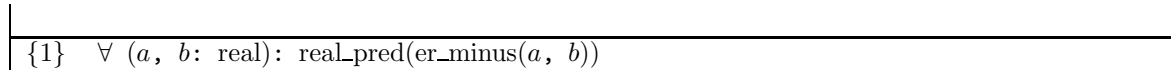
Terse proof for `er_plus_real`.
`er_plus_real:`



Repeatedly Skolemizing and flattening,
Rewriting using er_plus_ax, matching in *,
Rewriting using closed_plus, matching in *,
This completes the proof of `er_plus_real`.
Q.E.D.

C.94.10 Extended_Real.er_minus_real

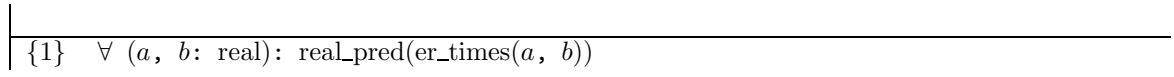
Terse proof for `er_minus_real`.
`er_minus_real:`



Repeatedly Skolemizing and flattening,
Rewriting using er_minus_ax, matching in *,
Rewriting using closed_minus, matching in *,
This completes the proof of `er_minus_real`.
Q.E.D.

C.94.11 Extended_Real.er_times_real

Terse proof for `er_times_real`.
`er_times_real:`



Repeatedly Skolemizing and flattening,
Rewriting using er_times_ax, matching in *,
Rewriting using closed_times, matching in *,
This completes the proof of `er_times_real`.
Q.E.D.

C.94.12 Extended_Real.er_div_real

Terse proof for `er_div_real`.
`er_div_real`:

|
|---
| {1} ∀ (a: real, b: nzreal): real_pred(er_div(a, b))

Repeatedly Skolemizing and flattening,
Rewriting using er_div_ax, matching in *,
Rewriting using closed_divides, matching in *,
This completes the proof of `er_div_real`.
Q.E.D.

C.94.13 Extended_Real.er_neg_real

Terse proof for `er_neg_real`.
`er_neg_real`:

|
|---
| {1} ∀ (a: real): real_pred(er_neg(a))

Repeatedly Skolemizing and flattening,
Rewriting using er_neg_ax, matching in *,
Rewriting using closed_neg, matching in *,
This completes the proof of `er_neg_real`.
Q.E.D.

C.94.14 Extended_Real.er_plus_rational

Terse proof for `er_plus_rational`.
`er_plus_rational`:

|
|---
| {1} ∀ (a, b: rational): rational_pred(er_plus(a, b))

Repeatedly Skolemizing and flattening,
Rewriting using er_plus_ax, matching in *,
Rewriting using closed_plus, matching in *,
This completes the proof of `er_plus_rational`.
Q.E.D.

C.94.15 Extended_Real.er_minus_rational

Terse proof for `er_minus_rational`.
`er_minus_rational`:

|
|---
| {1} ∀ (a, b: rational): rational_pred(er_minus(a, b))

Repeatedly Skolemizing and flattening,
Rewriting using er_minus_ax, matching in *,
Rewriting using closed_minus, matching in *,
This completes the proof of `er_minus_rational`.
Q.E.D.

C.94.16 Extended_Real.er_times_rational

Terse proof for `er_times_rational`.
`er_times_rational:`

```
|
|-------------------------------------------------------------------------------
| {1}  ∀ (a, b: rational): rational_pred(er_times(a, b))
```

Repeatedly Skolemizing and flattening,
Rewriting using er_times_ax, matching in *,
Rewriting using closed_times, matching in *,
This completes the proof of `er_times_rational`.
Q.E.D.

C.94.17 Extended_Real.er_div_rational

Terse proof for `er_div_rational`.
`er_div_rational:`

```
|
|-------------------------------------------------------------------------------
| {1}  ∀ (a: rational, b: nzrat): rational_pred(er_div(a, b))
```

Repeatedly Skolemizing and flattening,
Rewriting using er_div_ax, matching in *,
Rewriting using closed_divides, matching in *,
This completes the proof of `er_div_rational`.
Q.E.D.

C.94.18 Extended_Real.er_neg_rational

Terse proof for `er_neg_rational`.
`er_neg_rational:`

```
|
|-------------------------------------------------------------------------------
| {1}  ∀ (a: rational): rational_pred(er_neg(a))
```

Repeatedly Skolemizing and flattening,
Rewriting using er_neg_ax, matching in *,
Rewriting using closed_neg, matching in *,
This completes the proof of `er_neg_rational`.
Q.E.D.

C.94.19 Extended_Real.er_plus_integer

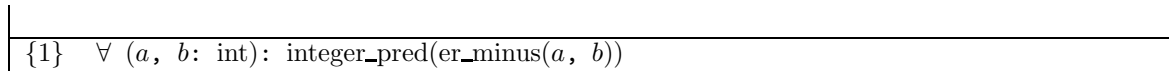
Terse proof for `er_plus_integer`.
`er_plus_integer:`

```
|
|-------------------------------------------------------------------------------
| {1}  ∀ (a, b: int): integer_pred(er_plus(a, b))
```

Repeatedly Skolemizing and flattening,
Rewriting using er_plus_ax, matching in *,
Rewriting using closed_plus, matching in *,
This completes the proof of `er_plus_integer`.
Q.E.D.

C.94.20 Extended_Real.er_minus_integer

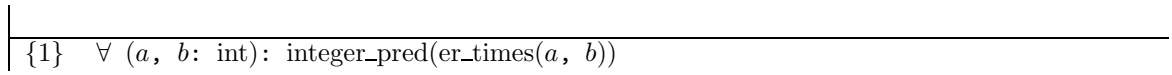
Terse proof for `er_minus_integer`.
`er_minus_integer`:



Repeatedly Skolemizing and flattening,
Rewriting using er_minus_ax, matching in *,
Rewriting using closed_minus, matching in *,
This completes the proof of `er_minus_integer`.
Q.E.D.

C.94.21 Extended_Real.er_times_integer

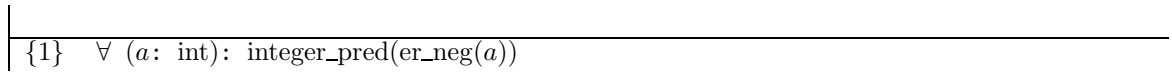
Terse proof for `er_times_integer`.
`er_times_integer`:



Repeatedly Skolemizing and flattening,
Rewriting using er_times_ax, matching in *,
Rewriting using closed_times, matching in *,
This completes the proof of `er_times_integer`.
Q.E.D.

C.94.22 Extended_Real.er_neg_integer

Terse proof for `er_neg_integer`.
`er_neg_integer`:

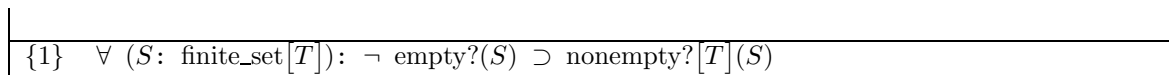


Repeatedly Skolemizing and flattening,
Rewriting using er_neg_ax, matching in *,
Rewriting using closed_neg, matching in *,
This completes the proof of `er_neg_integer`.
Q.E.D.

C.95 Proofs for Finite_Set_Reduce (vfiasco-prelude.pvs)

C.95.1 Finite_Set_Reduce.list_of_finite_set_TCC1

Terse proof for `list_of_finite_set_TCC1`.
`list_of_finite_set_TCC1`:



Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `list_of_finite_set_TCC1`.
Q.E.D.

C.95.2 Finite_Set_Reduce.list_of_finite_set_TCC2

Terse proof for `list_of_finite_set_TCC2`.

`list_of_finite_set_TCC2:`

$$\{1\}\quad \forall\ (S\colon \text{finite\_set}[T])\colon \neg\ \text{empty?}(S)\ \supset\ \text{card}[T](\text{rest}[T](S))\ <\ \text{card}[T](S)$$

Repeatedly Skolemizing and flattening,
Rewriting using card_rest, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `list_of_finite_set_TCC2`.
Q.E.D.

C.95.3 Finite_Set_Reduce.length_list_of_finite_set

Terse proof for `length_list_of_finite_set`.

`length_list_of_finite_set:`

$$\{1\}\quad \forall\ (S\colon \text{finite\_set}[T])\colon \text{length}(\text{list\_of\_finite\_set}(S))\ =\ \text{card}(S)$$

Case splitting on $\forall\ (i\colon \text{nat},\ S\colon \text{finite\_set}[T])\colon\ i = \text{card}(S) \supset \text{length}(\text{list\_of\_finite\_set}(S)) = \text{card}(S)$,
we get 2 subgoals:

`length_list_of_finite_set.1:`

$$\begin{array}{l}\{\text{-}1\}\quad \forall\ (i\colon \text{nat},\ S\colon \text{finite\_set}[T])\colon \\ \qquad i\ =\ \text{card}(S)\ \supset\ \text{length}(\text{list\_of\_finite\_set}(S))\ =\ \text{card}(S) \\ \hline \{1\}\quad \forall\ (S\colon \text{finite\_set}[T])\colon\ \text{length}(\text{list\_of\_finite\_set}(S))\ =\ \text{card}(S)\end{array}$$

Repeatedly Skolemizing and flattening,
Instantiating the top quantifier in -2 with the terms: $\text{card}(S')$, S',
This completes the proof of `length_list_of_finite_set.1`.

`length_list_of_finite_set.2:`

$$\begin{array}{l}\{1\}\quad \forall\ (i\colon \text{nat},\ S\colon \text{finite\_set}[T])\colon \\ \qquad i\ =\ \text{card}(S)\ \supset\ \text{length}(\text{list\_of\_finite\_set}(S))\ =\ \text{card}(S) \\ \{2\}\quad \forall\ (S\colon \text{finite\_set}[T])\colon\ \text{length}(\text{list\_of\_finite\_set}(S))\ =\ \text{card}(S)\end{array}$$

Hiding formulas: 2,
Inducting on i on formula 1,
we get 2 subgoals:

`length_list_of_finite_set.2.1:`

$$\{1\}\quad \forall\ (S\colon \text{finite\_set}[T])\colon\ 0\ =\ \text{card}(S)\ \supset\ \text{length}(\text{list\_of\_finite\_set}(S))\ =\ \text{card}(S)$$

Repeatedly Skolemizing and flattening,
Using lemma $\text{card\_empty?}[T]$,
Simplifying, rewriting, and recording with decision procedures,
Simplifying, rewriting, and recording with decision procedures,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `length_list_of_finite_set.2.1`.

`length_list_of_finite_set.2.2:`

{1} ∀ j:
(∀ (S: finite_set[T]):
j = card(S) ⊃ length(list_of_finite_set(S)) = card(S))
⊃
(∀ (S: finite_set[T]):
$j+1$ = card(S) ⊃ length(list_of_finite_set(S)) = card(S))

Repeatedly Skolemizing and flattening,
Using lemma card_empty?[T],
Simplifying, rewriting, and recording with decision procedures,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of list_of_finite_set,
Expanding the definition of length,
Instantiating quantified variables,
Rewriting using card_rest, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `length_list_of_finite_set.2.2`.
Q.E.D.

C.95.4 Finite_Set_Reduce.member_list_of_finite_set

Terse proof for `member_list_of_finite_set`.

`member_list_of_finite_set:`

{1} ∀ (S: finite_set[T], x: T): ($x \in S$) = member(x, list_of_finite_set(S))

Case splitting on ∀ (S: finite_set[T], k: nat, x: T): k = card(S) ⊃ (member(x, S) = member(x, list_of_finite_set(S))),
we get 2 subgoals:

`member_list_of_finite_set.1:`

{-1} ∀ (S: finite_set[T], k: nat, x: T):
k = card(S) ⊃ (($x \in S$) = member(x, list_of_finite_set(S)))

{1} ∀ (S: finite_set[T], x: T): ($x \in S$) = member(x, list_of_finite_set(S))

Repeatedly Skolemizing and flattening,
Instantiating quantified variables,
Instantiating quantified variables,
This completes the proof of `member_list_of_finite_set.1`.

`member_list_of_finite_set.2:`

{1} ∀ (S: finite_set[T], k: nat, x: T):
k = card(S) ⊃ (($x \in S$) = member(x, list_of_finite_set(S)))
{2} ∀ (S: finite_set[T], x: T): ($x \in S$) = member(x, list_of_finite_set(S))

Hiding formulas: 2,
Inducting on k on formula 1,
we get 2 subgoals:

`member_list_of_finite_set.2.1:`

{1} ∀ (S: finite_set[T], x: T):
0 = card(S) ⊃ ((x ∈ S) = member(x, list_of_finite_set(S)))

Repeatedly Skolemizing and flattening,
Using lemma card_empty?[T],
Simplifying, rewriting, and recording with decision procedures,
Simplifying, rewriting, and recording with decision procedures,
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `member_list_of_finite_set.2.1`.
`member_list_of_finite_set.2.2:`

{1} ∀ j:
(∀ (S: finite_set[T], x: T):
j = card(S) ⊃ ((x ∈ S) = member(x, list_of_finite_set(S))))
⊃
(∀ (S: finite_set[T], x: T):
j + 1 = card(S) ⊃ ((x ∈ S) = member(x, list_of_finite_set(S))))

Repeatedly Skolemizing and flattening,
Using lemma card_empty?[T],
Simplifying, rewriting, and recording with decision procedures,
Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of list_of_finite_set,
Expanding the definition of member,
Case splitting on x!1 = choose(S!1),
we get 2 subgoals:
`member_list_of_finite_set.2.2.1:`

{-1} x′ = choose(S′)
{-2} is_finite[T](S′)
{-3} j′ ≥ 0
{-4} ∀ (S: finite_set[T], x: T):
j′ = card(S) ⊃ ((x ∈ S) = member(x, list_of_finite_set(S)))
{-5} 1 + j′ = card(S′)

{1} empty?(S′)
{2} ((x′ ∈ S′) = (x′ = choose(S′) ∨ member(x′, list_of_finite_set(rest(S′)))))

Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of member,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `member_list_of_finite_set.2.2.1`.
`member_list_of_finite_set.2.2.2:`

{-1} is_finite[T](S′)
{-2} j′ ≥ 0
{-3} ∀ (S: finite_set[T], x: T):
j′ = card(S) ⊃ ((x ∈ S) = member(x, list_of_finite_set(S)))
{-4} 1 + j′ = card(S′)

{1} x′ = choose(S′)
{2} empty?(S′)
{3} ((x′ ∈ S′) = (x′ = choose(S′) ∨ member(x′, list_of_finite_set(rest(S′)))))

Simplifying, rewriting, and recording with decision procedures,

Instantiating the top quantifier in -3 with the terms: rest(S'), x',
Installing automatic rewrites from: card_rest
Simplifying, rewriting, and recording with decision procedures,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:
`member_list_of_finite_set.2.2.2.1:`

{-1}	is_finite$[T]$(S')
{-2}	$j' \geq 0$

{5} $i' = j''$

Hiding formulas: 1,
Using lemma nth_member[T],
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
This completes the proof of `unique_member_list_of_finite_set.2.2.2.1.2`.
`unique_member_list_of_finite_set.2.2.2.2:`

{-1} is_finite[T](S')
{-2} $i' < \text{length}(\text{list\_of\_finite\_set}(S'))$
{-3} $j'' < \text{length}(\text{list\_of\_finite\_set}(S'))$
{-4} $j' \geq 0$
{-5} $\forall$ (S: finite_set[T], i, j: below(length(list_of_finite_set(S)))):
$j' = \text{card}(S) \wedge \text{nth}(\text{list\_of\_finite\_set}(S), i) = \text{nth}(\text{list\_of\_finite\_set}(S), j)$
$\supset i = j$
{-6} $1 + j' = \text{card}(S')$
{-7} nth(cons(choose(S'), list_of_finite_set(rest(S'))), i') =
nth(cons(choose(S'), list_of_finite_set(rest(S'))), j'')

{1} $j'' = 0$
{2} $i' = 0$
{3} empty?(S')
{4} $i' = j''$

Expanding the definition of nth,

Simplifying, rewriting, and recording with decision procedures,
Instantiating the top quantifier in -5 with the terms: rest(S'), $i' - 1$, $j'' - 1$,
Rewriting using card_rest, matching in *,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `unique_member_list_of_finite_set.2.2.2.2`.
Q.E.D.

C.96 Proofs for General (constants.pvs)

C.96.1 General.Byte_TCC1

Terse proof for `Byte_TCC1`.
`Byte_TCC1`:

{1} $0 < \text{max\_byte}$

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `Byte_TCC1`.
Q.E.D.

C.96.2 General.less_than_max_byte

Terse proof for `less_than_max_byte`.
`less_than_max_byte`:

{1} $\forall\ (n\colon \text{nat})\colon\ n < \text{expt}(2,\ 8) \supset n < \text{max\_byte}$

Repeatedly Skolemizing and flattening,
Expanding the definition of max_byte,
Applying bits_per_byte_minimum
Expanding the definition of min_bits_per_byte,
Applying both_sides_expt_gt1_le
Instantiating the top quantifier in -1 with the terms: 2, 8, bits_per_byte,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `less_than_max_byte`.
Q.E.D.

C.97 Proofs for Graph (graph.pvs)

C.97.1 Graph.path?_TCC1

Terse proof for `path?_TCC1`.
`path?_TCC1`:

{1} $\forall\ (g\colon \text{graph\_type},\ l\colon (\text{path\_list?}[T]))\colon$
$(\forall\ (i\colon \text{below}(\text{length}(l)))\colon\ g\text{`nodes}(\text{nth}(l,\ i))) \supset$
$(\forall\ (i_1\colon \text{below}(\text{length}[T](l) - 1))\colon\ i_1 < \text{length}[T](l))$

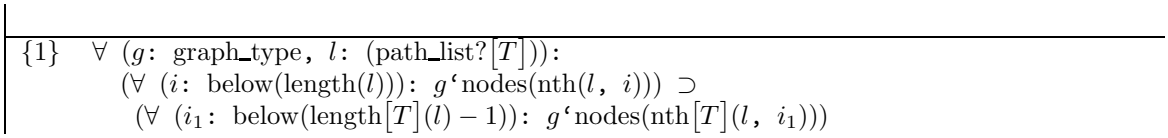
Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path?_TCC1`.

Q.E.D.

C.97.2 Graph.path?_TCC2

Terse proof for `path?_TCC2`.

`path?_TCC2:`

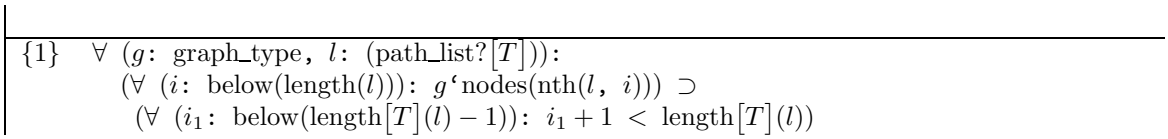


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path?_TCC2`.
Q.E.D.

C.97.3 Graph.path?_TCC3

Terse proof for `path?_TCC3`.

`path?_TCC3:`

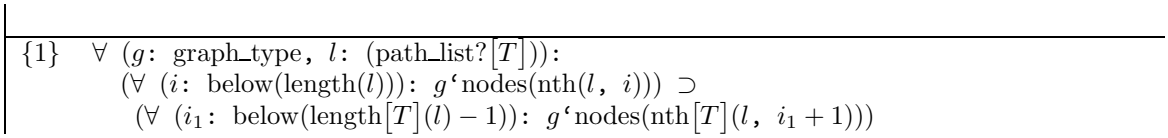


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path?_TCC3`.
Q.E.D.

C.97.4 Graph.path?_TCC4

Terse proof for `path?_TCC4`.

`path?_TCC4:`

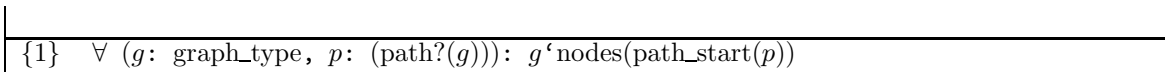


Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path?_TCC4`.
Q.E.D.

C.97.5 Graph.nodes_path_start

Terse proof for `nodes_path_start`.

`nodes_path_start:`



Repeatedly Skolemizing and flattening,
Expanding the definition of path_list?,
Expanding the definition of path_start,

Expanding the definition of path?,
Applying disjunctive simplification to flatten sequent,
Instantiating the top quantifier in -2 with the terms: 0,
we get 2 subgoals:
`nodes_path_start.1:`

{-1} length(p') $\geq$ 1
{-2} g'`nodes(nth(p', 0))
{-3} $\forall$ (i: below(length(p') $-$ 1)): g'`edges(nth(p', i), nth(p', 1 + i))

{1} g'`nodes(car(p'))

Expanding the definition of nth,
which is trivially true.
This completes the proof of `nodes_path_start.1`.
`nodes_path_start.2:`

{-1} length(p') $\geq$ 1
{-2} $\forall$ (i: below(length(p') $-$ 1)): g'`edges(nth(p', i), nth(p', 1 + i))

{1} 0 $<$ length$\lceil T \rceil$(p')
{2} g'`nodes(car(p'))

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nodes_path_start.2`.
Q.E.D.

C.97.6 Graph.nodes_path_end

Terse proof for `nodes_path_end`.
`nodes_path_end:`

{1} $\forall$ (g: graph_type, p: (path?(g))): g`nodes(path_end(p))

Repeatedly Skolemizing and flattening,
Expanding the definition of path_list?,
Expanding the definition of path_end,
Expanding the definition of path?,
Applying disjunctive simplification to flatten sequent,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `nodes_path_end`.
Q.E.D.

C.97.7 Graph.path_head_TCC1

Terse proof for `path_head_TCC1`.
`path_head_TCC1:`

{1} $\forall$ (g: graph_type, p: (path?(g)), n: upto(length$\lceil T \rceil$(p))):
$n \geq 1 \supset$ path_list?$\lceil T \rceil$(head$\lceil T \rceil$(p, n))

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path_head_TCC1`.
Q.E.D.

C.97.8 Graph.path_head

Terse proof for `path_head`.

`path_head:`

```
{1}  ∀ (g: graph_type, p: (path?(g)), n: upto(length(p))):
       n ≥ 1 ⊃ path?(g)(head(p, n))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of path?,
Installing automatic rewrites from: length_head length_tail nth_head nth_tail
Applying propositional simplification,
we get 2 subgoals:

`path_head.1:`

```
{-1}  path_list?[T](p')
{-2}  ∀ (i: below(length(p'))): g'`nodes(nth(p', i))
{-3}  ∀ (i: below(length(p') − 1)): g'`edges(nth(p', i), nth(p', 1 + i))
{-4}  n' ≤ length(p')
{-5}  n' ≥ 1
{1}   ∀ (i: below(length(head(p', n')))): g'`nodes(nth(head(p', n'), i))
```

Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
This completes the proof of `path_head.1`.

`path_head.2:`

```
{-1}  path_list?[T](p')
{-2}  ∀ (i: below(length(p'))): g'`nodes(nth(p', i))
{-3}  ∀ (i: below(length(p') − 1)): g'`edges(nth(p', i), nth(p', 1 + i))
{-4}  n' ≤ length(p')
{-5}  n' ≥ 1
{1}   ∀ (i: below(length(head(p', n')) − 1)):
        g'`edges(nth(head(p', n'), i), nth(head(p', n'), 1 + i))
```

Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
This completes the proof of `path_head.2`.
Q.E.D.

C.97.9 Graph.path_tail_TCC1

Terse proof for `path_tail_TCC1`.

`path_tail_TCC1:`

```
{1}  ∀ (g: graph_type, p: (path?(g)), n: upto(length[T](p))):
       length(p) − n ≥ 1 ⊃ path_list?[T](tail[T](p, n))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of path_list?,
Rewriting using length_tail, matching in *,
This completes the proof of `path_tail_TCC1`.

Q.E.D.

C.97.10 Graph.path_tail

Terse proof for `path_tail`.

`path_tail`:

```
{1}  ∀ (g: graph_type, p: (path?(g)), n: upto(length(p))):
       length(p) − n ≥ 1 ⊃ path?(g)(tail(p, n))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of path?,
Installing automatic rewrites from: length_head length_tail nth_head nth_tail
Applying propositional simplification,
we get 2 subgoals:

`path_tail.1`:

```
{-1}  path_list?[T](p′)
{-2}  ∀ (i: below(length(p′))): g′‘nodes(nth(p′, i))
{-3}  ∀ (i: below(length(p′) − 1)): g′‘edges(nth(p′, i), nth(p′, 1 + i))
{-4}  n′ ≤ length(p′)
{-5}  length(p′) − n′ ≥ 1
{1}  ∀ (i: below(length(tail(p′, n′)))): g′‘nodes(nth(tail(p′, n′), i))
```

Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
This completes the proof of `path_tail.1`.

`path_tail.2`:

```
{-1}  path_list?[T](p′)
{-2}  ∀ (i: below(length(p′))): g′‘nodes(nth(p′, i))
{-3}  ∀ (i: below(length(p′) − 1)): g′‘edges(nth(p′, i), nth(p′, 1 + i))
{-4}  n′ ≤ length(p′)
{-5}  length(p′) − n′ ≥ 1
{1}  ∀ (i: below(length(tail(p′, n′)) − 1)):
       g′‘edges(nth(tail(p′, n′), i), nth(tail(p′, n′), 1 + i))
```

Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_tail.2`.
Q.E.D.

C.97.11 Graph.path_cdr_TCC1

Terse proof for `path_cdr_TCC1`.

`path_cdr_TCC1`:

```
{1}  ∀ (g: graph_type, p: (path?(g))): cons?[T](p)
```

Trying repeated skolemization, instantiation, and if-lifting,
This completes the proof of `path_cdr_TCC1`.

Q.E.D.

C.97.12 Graph.path_cdr

Terse proof for `path_cdr`.

`path_cdr:`

{1} $\forall$ (g: graph_type, p: (path?(g))):
path_list?$[T]$(cdr(p)) $\supset$ path?(g)(cdr(p))

Repeatedly Skolemizing and flattening,
Expanding the definition of path_list?,
Installing automatic rewrites from: length_cdr tail
Simplifying, rewriting, and recording with decision procedures,
Using lemma path_tail,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_cdr`.
Q.E.D.

C.97.13 Graph.path_concat_path

Terse proof for `path_concat_path`.

`path_concat_path:`

{1} $\forall$ (g: graph_type, p_1, p_2: (path?(g))):
concatable?(p_1, p_2) $\supset$ path?(g)(concat_path(p_1, p_2))

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: path_list? path? nth_append_left nth_append_right length_append length_cdr length_concat_path concat_path
Simplifying, rewriting, and recording with decision procedures,
Applying disjunctive simplification to flatten sequent,
Applying propositional simplification,
we get 2 subgoals:

`path_concat_path.1:`

{-1} length(p'_1) $\geq$ 1
{-2} $\forall$ (i: below(length(p'_1))): g'`nodes(nth(p'_1, i))
{-3} $\forall$ (i: below(length(p'_1) $-$ 1)):
g'`edges(nth(p'_1, i), nth(p'_1, $1+i$))
{-4} length(p'_2) $\geq$ 1
{-5} $\forall$ (i: below(length(p'_2))): g'`nodes(nth(p'_2, i))
{-6} $\forall$ (i: below(length(p'_2) $-$ 1)):
g'`edges(nth(p'_2, i), nth(p'_2, $1+i$))
{-7} concatable?(p'_1, p'_2)

{1} $\forall$ (i: below(length(append(p'_1, cdr(p'_2))))):
g'`nodes(nth(append(p'_1, cdr(p'_2)), i))

Hiding formulas: -3, -6,
Repeatedly Skolemizing and flattening,
Simplifying, rewriting, and recording with decision procedures,
Case splitting on i!1 < length(p1!1),
we get 2 subgoals:

`path_concat_path.1.1:`

{-1}	$i' < \text{length}(p'_1)$
{-2}	$i' < \text{length}(p'_1) + \text{length}(p'_2) - 1$
{-3}	$\text{length}(p'_1) \geq 1$
{-4}	$\forall\ (i\colon\ \text{below}(\text{length}(p'_1)))\colon\ g\text{`}\text{nodes}(\text{nth}(p'_1,\ i))$

\end{array}
$$

Simplifying, rewriting, and recording with decision procedures,
Instantiating the top quantifier in -7 with the terms: $i' - \text{length}(p_1') + 1$,
Expanding the definition of nth,
which is trivially true.
This completes the proof of `path_concat_path.2.2.2`.
Q.E.D.

C.97.14 Graph.trans_closure_char_graph

Terse proof for `trans_closure_char_graph`.
`trans_closure_char_graph`:

$$
\begin{array}{ll}
\{1\} & \forall\ (g\text{: graph\_type}, x, y\text{: } (g\text{`nodes})): \\
 & \quad \text{transitive\_closure}(g\text{`edges})(x, y) \equiv \\
 & \quad (\exists\ (l\text{: } (\text{path?}(g))): \\
 & \qquad \text{length}(l) \geq 2 \wedge \text{path\_start}(l) = x \wedge \text{path\_end}(l) = y)
\end{array}
$$

Repeatedly Skolemizing and flattening,
Using lemma trans_closure_char,
Installing automatic rewrites from: length_stable nth_stable
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 2 subgoals:

`trans_closure_char_graph.1:`

{-1} transitive_closure(g`nodes)(x', y')
{-2} $\exists$ (l: list[(g`nodes)]):
length(l) $\geq$ 2 $\wedge$
path_start(l) = x' $\wedge$
path_end(l) = y' $\wedge$
($\forall$ (i: below(length(l) $-$ 1)):
g`edges(nth(l, i), nth(l, 1 + i)))
{-3} g`nodes(x')
{-4} g`nodes(y')

{1} $\exists$ (l: (path?(g'))): length(l) $\geq$ 2 $\wedge$ path_start(l) = x' $\wedge$ path_end(l) = y'

Keeping (-2 1) and hiding *,
Repeatedly Skolemizing and flattening,
Using lemma every_nth[T],
Simplifying, rewriting, and recording with decision procedures,
Installing automatic rewrites from: path? path_list?
Instantiating quantified variables,
we get 2 subgoals:
`trans_closure_char_graph.1.1:`

{-1} $\forall$ (i: below(length(l'))): g`nodes(nth(l', i))
{-2} every(g`nodes)(l')
{-3} length[T](l') $\geq$ 2
{-4} path_start(l') = x'
{-5} path_end(l') = y'
{-6} $\forall$ (i: below(length(l') $-$ 1)): g`edges(nth(l', i), nth(l', 1 + i))

{1} length(l') $\geq$ 2 $\wedge$ path_start(l') = x' $\wedge$ path_end(l') = y'

Simplifying, rewriting, and recording with decision procedures,
Expanding the definition of path_start,
Expanding the definition of path_end,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `trans_closure_char_graph.1.1`.
`trans_closure_char_graph.1.2:`

{-1} $\forall$ (i: below(length(l'))): g`nodes(nth(l', i))

C.97.15 Graph.path_cycle_free

Terse proof for `path_cycle_free`.

`path_cycle_free:`

{1} $\forall$ (g: graph_type):
cycle_free?(g) $\equiv$
($\forall$ (l: (path?(g)), i_1, i_2: below(length(l))):
nth(l, i_1) = nth(l, i_2) $\supset$ i_1 = i_2)

Repeatedly Skolemizing and flattening,

Installing automatic rewrites from: car_tail car_head nth_tail nth_head length_head length_tail path_list? path_head path_tail path_start path_end

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

we get 2 subgoals:

`path_cycle_free.1:`

{-1} cycle_free?(g')

{1} $\forall$ (l: (path?(g')), i_1, i_2: below(length(l))):
nth(l, i_1) = nth(l, i_2) $\supset$ i_1 = i_2

Repeatedly Skolemizing and flattening,

Expanding the definition of cycle_free?,

Instantiating the top quantifier in -5 with the terms: nth(l', i'_1),

Applying propositional simplification,

we get 2 subgoals:

`path_cycle_free.1.1:`

{-1} path_list?$[T]$(l')
{-2} path?(g')(l')
{-3} i'_1 < length(l')
{-4} i'_2 < length(l')
{-5} nth(l', i'_1) = nth(l', i'_2)

{1} transitive_closure(g`edges)(nth(l', i'_1), nth(l', i'_1))
{2} i'_1 = i'_2

Rewriting using trans_closure_char_graph, matching in *,

Case splitting on i1!1 < i2!1,

we get 2 subgoals:

`path_cycle_free.1.1.1:`

{-1} i'_1 < i'_2
{-2} path_list?$[T]$(l')
{-3} path?(g')(l')
{-4} i'_1 < length(l')
{-5} i'_2 < length(l')
{-6} nth(l', i'_1) = nth(l', i'_2)

{1} $\exists$ (l: (path?(g'))):
length(l) $\geq$ 2 $\wedge$
car(l) = nth(l', i'_1) $\wedge$ nth(l, length(l) $-$ 1) = nth(l', i'_1)
{2} i'_1 = i'_2

Instantiating the top quantifier in 1 with the terms: tail(head(l', $i'_2 + 1$), i'_1),

we get 3 subgoals:

`path_cycle_free.1.1.1.1:`

$$
\begin{array}{ll}
\{\text{-}1\} & i'_1 < i'_2 \\

C.97.17 Graph.tree_path

Terse proof for `tree_path`.

`tree_path:`

{1} ∀ (g: graph_type, p_1, p_2: (path?(g))):
tree?(g) ∧ path_end(p_1) = path_end(p_2) ∧ length(p_1) = length(p_2) ⊃ p_1 = p_2

For the top quantifier in 1, we introduce Skolem constants: (g' _ _),
Inducting on p1 on formula 1 using induction scheme path_list_induction$[T]$,
we get 3 subgoals:
`tree_path.1:`

{1} path?(g')(p_1')
{2} ∀ (p_2: (path?(g'))):
tree?(g') ∧ path_end(p_1') = path_end(p_2) ∧ length(p_1') = length(p_2) ⊃ p_1' = p_2

Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `tree_path.1`.
`tree_path.2:`

{1} ∀ (t: T):
path?(g')(cons(t, null)) ⊃
(∀ (p_2: (path?(g'))):
tree?(g') ∧
path_end(cons(t, null)) = path_end(p_2) ∧
length(cons(t, null)) = length(p_2)
⊃ cons(t, null) = p_2)

Repeatedly Skolemizing and flattening,
Installing automatic rewrites from: length path_end nth
Simplifying, rewriting, and recording with decision procedures,
Simplifying, rewriting, and recording with decision procedures,
Applying extensionality,
Expanding the definition of length,
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `tree_path.2`.
`tree_path.3:`

{1} ∀ (t: T, tail: (path_list?)):
(path?(g')(tail) ⊃
(∀ (p_2: (path?(g'))):
tree?(g') ∧ path_end(tail) = path_end(p_2) ∧ length(tail) = length(p_2) ⊃
tail = p_2))
⊃
path?(g')(cons(t, tail)) ⊃
(∀ (p_2: (path?(g'))):
tree?(g') ∧
path_end(cons(t, tail)) = path_end(p_2) ∧
length(cons(t, tail)) = length(p_2)
⊃ cons(t, tail) = p_2)

Repeatedly Skolemizing and flattening,
Using lemma path_cdr,
Simplifying, rewriting, and recording with decision procedures,

Expanding the definition of length,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,

Instantiating the top quantifier in -5 with the terms: $\mathrm{cdr}(p_2')$,

we get 2 subgoals:

`tree_path.3.1:`

{-1}	$\mathrm{path?}(g')(\mathrm{tail}')$
{-2}	$\mathrm{path\_list?}[T](p_2')$

{2} $\text{null?}(p_2')$
{3} $\text{cons}(t', \text{tail}') = p_2'$

Using lemma path_cdr,
Expanding the definition of path_list?,

Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
This completes the proof of `tree_path.3.2`.
Q.E.D.

C.97.18 Graph.root_path_TCC1

Terse proof for `root_path_TCC1`.
`root_path_TCC1:`

```
{1}  ∀ (g: graph_type, n: (g`nodes), p: (path?(g))): (g`nodes)(path_start[T](p))
```

Repeatedly Skolemizing and flattening,
Rewriting using nodes_path_start, matching in *,
This completes the proof of `root_path_TCC1`.
Q.E.D.

C.97.19 Graph.path_length_bound_TCC1

Terse proof for `path_length_bound_TCC1`.
`path_length_bound_TCC1:`

```
{1}  ∀ (g: graph_type):
       cycle_free?(g) ∧ finite?(g) ⊃ (∀ (p: (path?(g))): is_finite[T](g`nodes))
```

Repeatedly Skolemizing and flattening,
Expanding the definition of finite?,
which is trivially true.
This completes the proof of `path_length_bound_TCC1`.
Q.E.D.

C.97.20 Graph.path_length_bound

Terse proof for `path_length_bound`.
`path_length_bound:`

```
{1}  ∀ (g: graph_type):
       finite?(g) ∧ cycle_free?(g) ⊃
        (∀ (p: (path?(g))): length(p) ≤ card(g`nodes))
```

Repeatedly Skolemizing and flattening,
Using lemma list_pred_card[T],
Repeatedly simplifying with BDDs, decision procedures, rewriting, and if-lifting,
we get 3 subgoals:
`path_length_bound.1:`

```
{-1}  ∃ (n1, n2: below(length(p′))): ¬ n1 = n2 ∧ nth(p′, n1) = nth(p′, n2)
{-2}  path_list?[T](p′)
{-3}  path?(g′)(p′)
{-4}  finite?(g′)
{-5}  cycle_free?(g′)
{1}   length(p′) ≤ card(g′`nodes)
```

Repeatedly Skolemizing and flattening,
Using lemma path_cycle_free,
Simplifying, rewriting, and recording with decision procedures,
Instantiating quantified variables,
Simplifying, rewriting, and recording with decision procedures,
This completes the proof of `path_length_bound.1`.
`path_length_bound.2:`

{-1}	path_list?$[T]$(p')
{-2}	path?(g')(p')
{-3}	finite?(g')
{-4}	cycle_free?(g')
{1}	every(g'`nodes)(p')
{2}	length(p') $\leq$ card(g'`nodes)

Rewriting using every_nth, matching in *,
Expanding the definition of path?,
Applying disjunctive simplification to flatten sequent,
This completes the proof of `path_length_bound.2`.
`path_length_bound.3:`

{-1}	path_list?$[T]$(p')
{-2}	path?(g')(p')
{-3}	finite?(g')
{-4}	cycle_free?(g')
{1}	is_finite(g'`nodes)
{2}	length(p') $\leq$ card(g'`nodes)

Expanding the definition of finite?,
which is trivially true.
This completes the proof of `path_length_bound.3`.
Q.E.D.

C.97.21 Graph.non_root_path

Terse proof for `non_root_path`.
`non_root_path:`

{1}	$\forall$ (g: graph_type, n: (g`nodes)): roots(g)(n) $\vee$ ($\exists$ (p: (path?(g))): length(p) = 2 $\wedge$ path_end(p) = n)

Repeatedly Skolemizing and flattening,
Expanding the definition of roots,
Repeatedly Skolemizing and flattening,
Case splitting on length[T]((: x!1, n!1 :)) = 2,
we get 2 subgoals:
`non_root_path.1:`

{-1}	length$[T]$((:x', n':)) = 2
{-2}	g'`nodes(x')
{-3}	g'`nodes(n')
